It is appreciated that specific functions, and accordingly utilities, of GAM4544 RNA correlate with, and may be deduced from, the identity of the GAM4544 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4557 7285 TTAGCACCTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTATATTAC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATTCATTTTG Messenger 4557 (GAM4557) oligonucleotides modulates expression of respective target genes
ATGGTTTGTA whose function and utility is known in the art.

TCTCAAAGGA GAM4557 is a novel bioinformatically detectable regulatory, non protein coding,
GTACAGTGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4557 was detected is

CGAAACTTGT described with additional reference to Figs. 9-15.

TTAAAGATAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACCGGAAAGA encoded by the human genome.

AAAAGAGAAG GAM4557 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4557

AGGCAGAGTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4557

GCTTG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4557 precursor RNA is designated SEQ ID:7285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7285 is located from position 88520248 to position 88520362 relative to chromosome 9 on the `+` strand.

GAM4557 precursor RNA folds onto itself, forming GAM4557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4557 precursor RNA, designated SEQ ID NO: 7285, and a schematic representation of a predicted secondary folding of GAM4557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4557 folded precursor RNA yielding a GAM4557 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4557 RNA, hereby incorporated herein.

GAM4557 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4557 target RNA, herein designated GAM TARGET RNA. GAM4557 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4557 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4557 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4557 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4557 RNA, herein designated GAM RNA, to target

binding sites on GAM4557 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4557 target RNA into GAM4557 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4557 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4557 target genes. The mRNA of each one of this plurality of GAM4557 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4557 RNA, herein designated GAM RNA, and which when bound by GAM4557 RNA causes inhibition of translation of the GAM4557 target mRNA into a corresponding GAM4557 target protein.

The mechanism of the translational inhibition exerted by GAM4557 RNA, herein designated GAM RNA, on one or more GAM4557 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4557 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4557 RNA, herein designated GAM RNA, of GAM4557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4557 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4557 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4557 RNA correlate with, and may be deduced from, the identity of the GAM4557 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4561 6047 CCACACCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGCTGTGACC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGGCTAGTA Messenger 4561 (GAM4561) oligonucleotides modulates expression of respective target genes
GACAGTGGCA whose function and utility is known in the art.

ACATAGTCAT GAM4561 is a novel bioinformatically detectable regulatory, non protein coding,
CCCCAAGATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4561 was detected is

CTAATCTTCT described with additional reference to Figs. 9-15.

GCTGGAACTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCATACGTTA encoded by the human genome.

TCATGGTCAA GAM4561 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4561

TGTAAACCTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4561

GTTTGTGTGG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4561 precursor RNA is designated SEQ ID:6047, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6047 is located from position 158626687 to position 158626806 relative to chromosome 1 on the `+` strand.

GAM4561 precursor RNA folds onto itself, forming GAM4561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4561 precursor RNA, designated SEQ ID NO: 6047, and a schematic representation of a predicted secondary folding of GAM4561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4561 folded precursor RNA yielding a GAM4561 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4561 RNA, hereby incorporated herein. Expression of GAM4561 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM4561 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4561 target RNA, herein designated GAM TARGET RNA. GAM4561 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4561 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4561 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4561 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4561 RNA, herein designated GAM RNA, to target binding sites on GAM4561 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4561 target RNA into GAM4561 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4561 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4561 target genes. The mRNA of each one of this plurality of GAM4561 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4561 RNA, herein designated GAM RNA, and which when bound by GAM4561 RNA causes inhibition of translation of the GAM4561 target mRNA into a corresponding GAM4561 target protein.

The mechanism of the translational inhibition exerted by GAM4561 RNA, herein designated GAM RNA, on one or more GAM4561 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4561 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4561 RNA, herein designated GAM RNA, of GAM4561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4561 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4561 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4561 RNA correlate with, and may be deduced from, the identity of the GAM4561 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4571 5826 AGTTCTGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTGCTGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAACATTTT Messenger 4571 (GAM4571) oligonucleotides modulates expression of respective target genes

AGGTTCTGAT whose function and utility is known in the art.

AGCTGTATTC GAM4571 is a novel bioinformatically detectable regulatory, non protein coding,
TCAGTCCTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4571 was detected is

AGTGACAGGT described with additional reference to Figs. 9-15.

GTAGCCTGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTACT encoded by the human genome.

GAM4571 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4571

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4571

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4571 precursor RNA is designated SEQ ID:5826, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5826 is located from position 54394158 to position 54394243 relative to chromosome 19 on the `+` strand.

GAM4571 precursor RNA folds onto itself, forming GAM4571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4571 precursor RNA, designated SEQ ID NO: 5826, and a schematic representation of a predicted secondary folding of GAM4571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4571 folded precursor RNA yielding a GAM4571 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4571 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4571 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4571 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4571 target RNA, herein designated GAM TARGET RNA. GAM4571 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4571 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM4571 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4571 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4571 RNA, herein designated GAM RNA, to target binding sites on GAM4571 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4571 target RNA into GAM4571 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4571 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4571 target genes. The mRNA of each one of this plurality of GAM4571 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4571 RNA, herein designated GAM RNA, and which when bound by GAM4571 RNA causes inhibition of translation of the GAM4571 target mRNA into a corresponding GAM4571 target protein.

The mechanism of the translational inhibition exerted by GAM4571 RNA, herein designated GAM RNA, on one or more GAM4571 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4571 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4571 RNA, herein designated GAM RNA, of GAM4571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4571 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4571 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4571 RNA correlate with, and may be deduced from, the identity of the GAM4571 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4633 7197 TGCATTACCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCCCCAACTT detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAATCTTTT Messenger 4633 (GAM4633) oligonucleotides modulates expression of respective target genes

GATAACCCAG whose function and utility is known in the art.

GCAGCTGGGT GAM4633 is a novel bioinformatically detectable regulatory, non protein coding,

TATCCCCAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4633 was detected is

TTAAAGTCTT described with additional reference to Figs. 9-15.

TTTGTTGTAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGTATGGCA encoded by the human genome.

GAM4633 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4633

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4633

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4633 precursor RNA is designated SEQ ID:7197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7197 is located from position 71710862 to position 71710951 relative to chromosome X on the `-` strand.

GAM4633 precursor RNA folds onto itself, forming GAM4633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4633 precursor RNA, designated SEQ ID NO: 7197, and a schematic representation of a predicted secondary folding of GAM4633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4633 folded precursor RNA yielding a GAM4633 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4633 RNA, hereby incorporated herein.

GAM4633 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4633 target RNA, herein designated GAM TARGET RNA. GAM4633 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4633 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4633 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4633 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4633 RNA, herein designated GAM RNA, to target binding sites on GAM4633 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4633 target RNA into GAM4633 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4633 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4633 target genes. The mRNA of each one of this plurality of GAM4633 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4633 RNA, herein designated GAM RNA, and which when bound by GAM4633 RNA causes inhibition of translation of the GAM4633 target mRNA into a corresponding GAM4633 target protein.

The mechanism of the translational inhibition exerted by GAM4633 RNA, herein designated GAM RNA, on one or more GAM4633 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4633 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4633 RNA, herein designated GAM RNA, of GAM4633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4633 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4633 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4633 RNA correlate with, and may be deduced from, the identity of the GAM4633 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4650 6608 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 4650 (GAM4650) oligonucleotides modulates expression of respective target genes
TTGCAGTGAG whose function and utility is known in the art.

CCAAGATCGT GAM4650 is a novel bioinformatically detectable regulatory, non protein coding,
GCCACTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4650 was detected is

TCCAGCCTGG described with additional reference to Figs. 9-15.

GTGATAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGACTCC encoded by the human genome.

GAM4650 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4650

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4650
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4650 precursor RNA is designated SEQ ID:6608, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6608 is located from position 66913128 to position 66913215 relative to chromosome 17 on the `+` strand.

GAM4650 precursor RNA folds onto itself, forming GAM4650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4650 precursor RNA, designated SEQ ID NO: 6608, and a schematic representation of a predicted secondary folding of GAM4650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4650 folded precursor RNA yielding a GAM4650 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM4650 RNA, hereby incorporated herein.

GAM4650 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4650 target RNA, herein designated GAM TARGET RNA. GAM4650 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4650 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4650 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4650 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4650 RNA, herein designated GAM RNA, to target binding sites on GAM4650 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4650 target RNA into GAM4650 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4650 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4650 target genes. The mRNA of each one of this plurality of GAM4650 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4650 RNA, herein designated GAM RNA, and which when bound by GAM4650 RNA causes inhibition of translation of the GAM4650 target mRNA into a corresponding GAM4650 target protein.

The mechanism of the translational inhibition exerted by GAM4650 RNA, herein designated GAM RNA, on one or more GAM4650 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4650 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4650 RNA, herein designated GAM RNA, of GAM4650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4650 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4650 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4650 RNA correlate with, and may be deduced from, the identity of the GAM4650 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4656 6976 TAGTGACAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GGCATCCCAA detected oligonucleotides of the present invention, referred to here as Genomic Address
GGCACTTGCC Messenger 4656 (GAM4656) oligonucleotides modulates expression of respective target genes
CAGAGCTGCA whose function and utility is known in the art.

GAGTTGTGTG GAM4656 is a novel bioinformatically detectable regulatory, non protein coding,
TGCCATACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4656 was detected is

GCGGCTCAAA described with additional reference to Figs. 9-15.

GGGAAGGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTATCCCCT encoded by the human genome.

GAGTTTCTA GAM4656 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4656
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4656
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4656 precursor RNA is designated SEQ ID:6976, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6976 is located from position 142589577 to position 142589675 relative to chromosome 5 on the `+` strand.

GAM4656 precursor RNA folds onto itself, forming GAM4656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4656 precursor RNA, designated SEQ ID NO: 6976, and a schematic representation of a predicted secondary folding of GAM4656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4656 folded precursor RNA

yielding a GAM4656 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4656 RNA, hereby incorporated herein. Expression of GAM4656 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM4656 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4656 target RNA, herein designated GAM TARGET RNA. GAM4656 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4656 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4656 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4656 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4656 RNA, herein designated GAM RNA, to target binding sites on GAM4656 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4656 target RNA into GAM4656 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4656 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4656 target genes. The mRNA of each one of this plurality of GAM4656 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4656 RNA, herein designated GAM RNA, and which when bound by GAM4656 RNA causes inhibition of translation of the GAM4656 target mRNA into a corresponding GAM4656 target protein.

The mechanism of the translational inhibition exerted by GAM4656 RNA, herein designated GAM RNA, on one or more GAM4656 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4656 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4656 RNA, herein designated GAM RNA, of GAM4656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4656 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4656 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4656 RNA correlate with, and may be deduced from, the identity of the GAM4656 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4671 6087 CCCTGCCGCA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGAGAGCCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTTCAGAGAT Messenger 4671 (GAM4671) oligonucleotides modulates expression of respective target genes
GCCCTGAGTG whose function and utility is known in the art.

ATCGTCACCA GAM4671 is a novel bioinformatically detectable regulatory, non protein coding,
GCTGCATCCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4671 was detected is

GCAAACTTCA described with additional reference to Figs. 9-15.

TCTTGCTGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTGTGGCTT encoded by the human genome.

GG GAM4671 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4671
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4671
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4671 precursor RNA is designated SEQ ID:6087, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6087 is located from position 840148 to position 840239 relative to chromosome 10 on the `-` strand.

GAM4671 precursor RNA folds onto itself, forming GAM4671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4671 precursor RNA, designated SEQ ID NO: 6087, and a schematic representation of a predicted secondary folding of GAM4671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4671 folded precursor RNA yielding a GAM4671 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4671 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4671 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4671 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4671 target RNA, herein designated GAM TARGET RNA. GAM4671 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4671 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4671 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4671 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4671 RNA, herein designated GAM RNA, to target binding sites on GAM4671 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4671 target RNA into GAM4671 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4671 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4671 target genes. The mRNA of each one of this plurality of GAM4671 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4671 RNA, herein designated GAM RNA, and which when bound by GAM4671 RNA causes inhibition of translation of the GAM4671 target mRNA into a corresponding GAM4671 target protein.

The mechanism of the translational inhibition exerted by GAM4671 RNA, herein designated GAM RNA, on one or more GAM4671 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4671 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4671 RNA, herein designated GAM RNA, of GAM4671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4671 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4671 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4671 RNA correlate with, and may be deduced from, the identity of the GAM4671 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4685 7348 TTTTCAATTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAAAAATTA detected oligonucleotides of the present invention, referred to here as Genomic Address
GATTTATTGC Messenger 4685 (GAM4685) oligonucleotides modulates expression of respective target genes
AGACTGGCCT whose function and utility is known in the art.

CAAGCTCCCA GAM4685 is a novel bioinformatically detectable regulatory, non protein coding,
GACTATATTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4685 was detected is

TTTAGCTGCA described with additional reference to Figs. 9-15.

TTATTTAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTGAAATGC encoded by the human genome.

CAGCTTTTGA GAM4685 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4685
GACTTTTGAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4685
AA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4685 precursor RNA is designated SEQ ID:7348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7348 is located from position 26788414 to position 26788525 relative to chromosome 17 on the `+` strand.

GAM4685 precursor RNA folds onto itself, forming GAM4685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4685 precursor RNA, designated SEQ ID NO: 7348, and a schematic representation of a predicted secondary folding of GAM4685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4685 folded precursor RNA yielding a GAM4685 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4685 RNA, hereby incorporated herein.

GAM4685 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4685 target RNA, herein designated GAM TARGET RNA. GAM4685 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4685 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4685 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4685 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4685 RNA, herein designated GAM RNA, to target binding sites on GAM4685 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4685 target RNA into GAM4685 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4685 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4685 target genes. The mRNA of each one of this plurality of GAM4685 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4685 RNA, herein designated GAM RNA, and which when bound by GAM4685 RNA causes inhibition of translation

of the GAM4685 target mRNA into a corresponding GAM4685 target protein.

The mechanism of the translational inhibition exerted by GAM4685 RNA, herein designated GAM RNA, on one or more GAM4685 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4685 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4685 RNA, herein designated GAM RNA, of GAM4685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4685 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4685 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4685 RNA correlate with, and may be deduced from, the identity of the GAM4685 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTCTCCCAT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGTCATTTT Messenger 4690 (GAM4690) oligonucleotides modulates expression of respective target genes

TCTCTTTCCA whose function and utility is known in the art.

TAAAAAGCTA GAM4690 is a novel bioinformatically detectable regulatory, non protein coding,

ATGGTGACGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4690 was detected is

TATCAAAGAG described with additional reference to Figs. 9-15.

TGAAGGAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGGCTAAG encoded by the human genome.

GGTGGGGAAC GAM4690 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4690

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4690

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of GAM4690 precursor RNA is designated SEQ ID:6943, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6943 is located from position 42013351 to position 42013450 relative to chromosome 20 on the `+` strand.

GAM4690 precursor RNA folds onto itself, forming GAM4690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4690 precursor RNA, designated SEQ ID NO: 6943, and a schematic representation of a predicted secondary folding of GAM4690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4690 folded precursor RNA yielding a GAM4690 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4690 RNA, hereby incorporated herein.

GAM4690 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4690 target RNA, herein designated GAM TARGET RNA. GAM4690 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4690 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4690 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4690 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4690 RNA, herein designated GAM RNA, to target binding sites on GAM4690 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4690 target RNA into GAM4690 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4690 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4690 target genes. The mRNA of each one of this plurality of GAM4690 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4690 RNA, herein designated GAM RNA, and which when bound by GAM4690 RNA causes inhibition of translation of the GAM4690 target mRNA into a corresponding GAM4690 target protein.

The mechanism of the translational inhibition exerted by GAM4690 RNA, herein designated GAM RNA, on one or more GAM4690 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4690 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4690 RNA, herein designated GAM RNA, of GAM4690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4690 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4690 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4690 RNA correlate with, and may be deduced from, the identity of the GAM4690 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4707 6407 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGTTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGGAGG Messenger 4707 (GAM4707) oligonucleotides modulates expression of respective target genes

CGGAGGTTGT whose function and utility is known in the art.

GTTGAGCCGA GAM4707 is a novel bioinformatically detectable regulatory, non protein coding,

GATCTCGCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4707 was detected is

TTGCACTCCA described with additional reference to Figs. 9-15.

GCCTAGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGCGAA encoded by the human genome.

ACTCCATCTC GAM4707 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4707 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4707 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4707 precursor RNA is designated SEQ ID:6407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6407 is located from position 94524960 to position 94525059 relative to chromosome X on the `+` strand.

GAM4707 precursor RNA folds onto itself, forming GAM4707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4707 precursor RNA, designated SEQ ID NO: 6407, and a schematic representation of a predicted secondary folding of GAM4707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4707 folded precursor RNA yielding a GAM4707 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4707 RNA, hereby incorporated herein.

GAM4707 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4707 target RNA, herein designated GAM TARGET RNA. GAM4707 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4707 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4707 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4707 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4707 RNA, herein designated GAM RNA, to target

binding sites on GAM4707 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4707 target RNA into GAM4707 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4707 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4707 target genes. The mRNA of each one of this plurality of GAM4707 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4707 RNA, herein designated GAM RNA, and which when bound by GAM4707 RNA causes inhibition of translation of the GAM4707 target mRNA into a corresponding GAM4707 target protein.

The mechanism of the translational inhibition exerted by GAM4707 RNA, herein designated GAM RNA, on one or more GAM4707 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4707 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4707 RNA, herein designated GAM RNA, of GAM4707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4707 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4707 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4707 RNA correlate with, and may be deduced from, the identity of the GAM4707 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4709 6212 CTGCAGTGGT Fig. 8 further provides a conceptual description of another novel bioinformatically
GATGTGTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
CACTTCAGGA Messenger 4709 (GAM4709) oligonucleotides modulates expression of respective target genes
CACCCCACTA whose function and utility is known in the art.

CCTGAATTGC GAM4709 is a novel bioinformatically detectable regulatory, non protein coding,
AGCAGTGTTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4709 was detected is

CGAATCATCA described with additional reference to Figs. 9-15.

CTCTGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM4709 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4709 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4709 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4709 precursor RNA is designated SEQ ID:6212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6212 is located from position 97691104 to position 97691181 relative to chromosome 9 on the `+` strand.

GAM4709 precursor RNA folds onto itself, forming GAM4709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4709 precursor RNA, designated SEQ ID NO: 6212, and a schematic representation of a predicted secondary folding of GAM4709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4709 folded precursor RNA yielding a GAM4709 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4709 RNA, hereby incorporated herein.

GAM4709 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4709 target RNA, herein designated GAM TARGET RNA. GAM4709 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4709 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4709 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4709 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4709 RNA, herein designated GAM RNA, to target binding sites on GAM4709 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4709 target RNA into GAM4709 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4709 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4709 target genes. The mRNA of each one of this plurality of GAM4709 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4709 RNA, herein designated GAM RNA, and which when bound by GAM4709 RNA causes inhibition of translation of the GAM4709 target mRNA into a corresponding GAM4709 target protein.

The mechanism of the translational inhibition exerted by GAM4709 RNA, herein designated GAM RNA, on one or more GAM4709 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4709 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4709 RNA, herein designated GAM RNA, of GAM4709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4709 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4709 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4709 RNA correlate with, and may be deduced from, the identity of the GAM4709 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4733 5648 AAACGTGTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGATTGATGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTCATGGAC Messenger 4733 (GAM4733) oligonucleotides modulates expression of respective target genes

TCTGTTGCCC whose function and utility is known in the art.

CAAGTCCCCA GAM4733 is a novel bioinformatically detectable regulatory, non protein coding, AGCCTTGTAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4733 was detected is

CAGCGTTT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4733 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4733

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4733

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4733 precursor RNA is designated SEQ ID:5648, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5648 is located from position 99149260 to position 99149327 relative to chromosome 13 on the `+` strand.

GAM4733 precursor RNA folds onto itself, forming GAM4733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4733 precursor RNA, designated SEQ ID NO: 5648, and a schematic representation of a predicted secondary folding of GAM4733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4733 folded precursor RNA yielding a GAM4733 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4733 RNA, hereby incorporated herein.

GAM4733 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4733 target RNA, herein designated GAM TARGET RNA. GAM4733 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4733 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4733 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM4733 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4733 RNA, herein designated GAM RNA, to target binding sites on GAM4733 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4733 target RNA into GAM4733 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4733 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4733 target genes. The mRNA of each one of this plurality of GAM4733 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4733 RNA, herein designated GAM RNA, and which when bound by GAM4733 RNA causes inhibition of translation of the GAM4733 target mRNA into a corresponding GAM4733 target protein.

The mechanism of the translational inhibition exerted by GAM4733 RNA, herein designated GAM RNA, on one or more GAM4733 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4733 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4733 RNA, herein designated GAM RNA, of GAM4733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4733 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4733 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4733 RNA correlate with, and may be deduced from, the identity of the GAM4733 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4738 5784 AGGCTGTATG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGTTAATGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TAATCGTGAT Messenger 4738 (GAM4738) oligonucleotides modulates expression of respective target
genes
AGGGGTTTTT whose function and utility is known in the art.

GCCTCCAACT GAM4738 is a novel bioinformatically detectable regulatory, non protein coding,
GACTCCTACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4738 was detected is

TATTAGCATT described with additional reference to Figs. 9-15.

AACAGTGTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
GATGCCT encoded by the human genome.

GAM4738 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4738

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM4738

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4738 precursor RNA is designated SEQ ID:5784, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5784 is located from position 25868152 to position 25868238 relative to chromosome 21 on the `+` strand.

GAM4738 precursor RNA folds onto itself, forming GAM4738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4738 precursor RNA, designated SEQ ID NO: 5784, and a schematic representation of a predicted secondary folding of GAM4738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4738 folded precursor RNA yielding a GAM4738 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4738 RNA, hereby incorporated herein.

GAM4738 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4738 target RNA, herein designated GAM TARGET RNA. GAM4738 target
RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4738 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4738 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4738 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4738 RNA, herein designated GAM RNA, to target binding sites on GAM4738 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4738 target RNA into GAM4738 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4738 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4738 target genes. The mRNA of each one of this plurality of GAM4738 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4738 RNA, herein designated GAM RNA, and which when bound by GAM4738 RNA causes inhibition of translation of the GAM4738 target mRNA into a corresponding GAM4738 target protein.

The mechanism of the translational inhibition exerted by GAM4738 RNA, herein designated GAM RNA, on one or more GAM4738 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4738 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4738 RNA, herein designated GAM RNA, of GAM4738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4738 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4738 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4738 RNA correlate with, and may be deduced from, the identity of the GAM4738 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4769 6231 CTGGGATTAC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGCACCTGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGCCAAGTCT Messenger 4769 (GAM4769) oligonucleotides modulates expression of respective target genes
GGCTAATTTT whose function and utility is known in the art.

TGTATTTTTA GAM4769 is a novel bioinformatically detectable regulatory, non protein coding,
ATAGAGACGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4769 was detected is

GGTTTCGCTA described with additional reference to Figs. 9-15.

TGTTGGCCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTGGTCTCG encoded by the human genome.

AACTCCTGAT GAM4769 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4769
CTCAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4769

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4769 precursor RNA is designated SEQ ID:6231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6231 is located from position 128497043 to position 128497147 relative to chromosome 8 on the `+` strand.

GAM4769 precursor RNA folds onto itself, forming GAM4769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4769 precursor RNA, designated SEQ ID NO: 6231, and a schematic representation of a predicted secondary folding of GAM4769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4769 folded precursor RNA yielding a GAM4769 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4769 RNA, hereby incorporated herein.

GAM4769 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM4769 target RNA, herein designated GAM TARGET RNA. GAM4769 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4769 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4769 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4769 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4769 RNA, herein designated GAM RNA, to target binding sites on GAM4769 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4769 target RNA into GAM4769 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4769 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4769 target genes. The mRNA of each one of this plurality of GAM4769 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4769 RNA, herein designated GAM RNA, and which when bound by GAM4769 RNA causes inhibition of translation of the GAM4769 target mRNA into a corresponding GAM4769 target protein.

The mechanism of the translational inhibition exerted by GAM4769 RNA, herein designated GAM RNA, on one or more GAM4769 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4769 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4769 RNA, herein designated GAM RNA, of GAM4769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4769 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM4769 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4769 RNA correlate with, and may be deduced from, the identity of the GAM4769 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4796 6951 TAAAACTCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CATCAAATAG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGTAATCTT Messenger 4796 (GAM4796) oligonucleotides modulates expression of respective target genes

ATTAATTACA whose function and utility is known in the art.

CATTTTGTAT GAM4796 is a novel bioinformatically detectable regulatory, non protein coding,

TTTAATTATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4796 was detected is

TCAAGGAGTG described with additional reference to Figs. 9-15.

AAGAAAACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTGTTTTTG encoded by the human genome.

TTTTTGTAGT GAM4796 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4796

TCTGATTACT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4796

CATTTATGCA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TTGTTTTG to the nucleotide sequence of GAM4796 precursor RNA is designated SEQ ID:6951, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6951 is located from position 37551256 to position 37551383 relative to chromosome 19 on the `+` strand.

GAM4796 precursor RNA folds onto itself, forming GAM4796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4796 precursor RNA, designated SEQ ID NO: 6951, and a schematic representation of a predicted secondary folding of GAM4796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4796 folded precursor RNA yielding a GAM4796 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor

product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4796 RNA, hereby incorporated herein.

GAM4796 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4796 target RNA, herein designated GAM TARGET RNA. GAM4796 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4796 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4796 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4796 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4796 RNA, herein designated GAM RNA, to target binding sites on GAM4796 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4796 target RNA into GAM4796 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4796 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4796 target genes. The mRNA of each one of this plurality of GAM4796 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4796 RNA, herein designated GAM RNA, and which when bound by GAM4796 RNA causes inhibition of translation of the GAM4796 target mRNA into a corresponding GAM4796 target protein.

The mechanism of the translational inhibition exerted by GAM4796 RNA, herein designated GAM RNA, on one or more GAM4796 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4796 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4796 RNA, herein designated GAM RNA, of GAM4796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4796 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4796 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4796 RNA correlate with, and may be deduced from, the identity of the GAM4796 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4800 6745 GGCCACTTCC Fig. 8 further provides a conceptual description of another novel bioinformatically
ACCTTCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GCATAGGTGA Messenger 4800 (GAM4800) oligonucleotides modulates expression of respective target genes
CCCCTGTGGA whose function and utility is known in the art.

AAACAAGTAC GAM4800 is a novel bioinformatically detectable regulatory, non protein coding,
CCCTGGAACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4800 was detected is

TCCTAGAAGT described with additional reference to Figs. 9-15.

GGAGGTGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
C encoded by the human genome.

GAM4800 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4800

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4800
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4800 precursor RNA is designated SEQ ID:6745, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6745 is located from position 90601712 to position 90601792 relative to chromosome 15 on the `-` strand.

GAM4800 precursor RNA folds onto itself, forming GAM4800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4800 precursor RNA, designated SEQ ID NO: 6745, and a schematic representation of a predicted secondary folding of GAM4800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4800 folded precursor RNA yielding a GAM4800 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4800 RNA, hereby incorporated herein.

GAM4800 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4800 target RNA, herein designated GAM TARGET RNA. GAM4800 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4800 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4800 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4800 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4800 RNA, herein designated GAM RNA, to target binding sites on GAM4800 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4800 target RNA into GAM4800 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4800 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4800 target genes. The mRNA of each one of this plurality of GAM4800 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4800 RNA, herein designated GAM RNA, and which when bound by GAM4800 RNA causes inhibition of translation of the GAM4800 target mRNA into a corresponding GAM4800 target protein.

The mechanism of the translational inhibition exerted by GAM4800 RNA, herein designated GAM RNA, on one or more GAM4800 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4800 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4800 RNA, herein designated GAM RNA, of GAM4800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4800 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4800 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4800 RNA correlate with, and may be deduced from, the identity of the GAM4800 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4803 7220 TGGAGGAATG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAGCTATGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCAAATACTG Messenger 4803 (GAM4803) oligonucleotides modulates expression of respective target genes

GGAGCTGGCT whose function and utility is known in the art.

GGATGCCAGG GAM4803 is a novel bioinformatically detectable regulatory, non protein coding,

ATACAGCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4803 was detected is

CATCTGCCAT described with additional reference to Figs. 9-15.

CATTACCCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTTCAGGAT encoded by the human genome.

CCTCTA GAM4803 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4803

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4803

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4803 precursor RNA is designated SEQ ID:7220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7220 is located from position 128048648 to position 128048743 relative to chromosome 7 on the `-` strand.

GAM4803 precursor RNA folds onto itself, forming GAM4803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4803 precursor RNA, designated SEQ ID NO: 7220, and a schematic representation of a predicted secondary folding of GAM4803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4803 folded precursor RNA yielding a GAM4803 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4803 RNA, hereby incorporated herein.

GAM4803 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4803 target RNA, herein designated GAM TARGET RNA. GAM4803 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4803 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4803 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4803 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4803 RNA, herein designated GAM RNA, to target binding sites on GAM4803 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4803 target RNA into GAM4803 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4803 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4803 target genes. The mRNA of each one of this plurality of GAM4803 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4803 RNA, herein designated GAM RNA, and which when bound by GAM4803 RNA causes inhibition of translation of the GAM4803 target mRNA into a corresponding GAM4803 target protein.

The mechanism of the translational inhibition exerted by GAM4803 RNA, herein designated GAM RNA, on one or more GAM4803 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4803 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4803 RNA, herein designated GAM RNA, of GAM4803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4803 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4803 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4803 RNA correlate with, and may be deduced from, the identity of the GAM4803 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4814 7047 TCGCTCTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCCCAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGAGTGCAG Messenger 4814 (GAM4814) oligonucleotides modulates expression of respective target genes

TGGCATGATC whose function and utility is known in the art.

TCGGCTCACT GAM4814 is a novel bioinformatically detectable regulatory, non protein coding,

GCAACCTCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4814 was detected is

CCTCCTGGGT described with additional reference to Figs. 9-15.

TCAAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM4814 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4814

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4814

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4814 precursor RNA is designated SEQ ID:7047, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7047 is located from position 51241197 to position 51241274 relative to chromosome 10 on the `+` strand.

GAM4814 precursor RNA folds onto itself, forming GAM4814 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4814 precursor RNA, designated SEQ ID NO: 7047, and a schematic representation of a predicted secondary folding of GAM4814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4814 folded precursor RNA yielding a GAM4814 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4814 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4814 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4814 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4814 target RNA, herein designated GAM TARGET RNA. GAM4814 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4814 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4814 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4814 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4814 RNA, herein designated GAM RNA, to target binding sites on GAM4814 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4814 target RNA into GAM4814 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4814 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4814 target genes. The mRNA of each one of this plurality of GAM4814 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4814 RNA, herein designated GAM RNA, and which when bound by GAM4814 RNA causes inhibition of translation

of the GAM4814 target mRNA into a corresponding GAM4814 target protein.

The mechanism of the translational inhibition exerted by GAM4814 RNA, herein designated GAM RNA, on one or more GAM4814 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4814 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4814 RNA, herein designated GAM RNA, of GAM4814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4814 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4814 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4814 RNA correlate with, and may be deduced from, the identity of the GAM4814 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4821 6985 TATTATTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
CACCTGTTAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGAGACACT Messenger 4821 (GAM4821) oligonucleotides modulates expression of respective target genes
GTCCTAGGCA whose function and utility is known in the art.

CTGTGGGATA GAM4821 is a novel bioinformatically detectable regulatory, non protein coding,
ACAACAGCAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4821 was detected is

ACACTTCACA described with additional reference to Figs. 9-15.

CAACAGCCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCCTTCCTGT encoded by the human genome.

GTTTTACAAC GAM4821 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4821
AGCTCCTAAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4821
GATA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of GAM4821 precursor RNA is designated SEQ ID:6985, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6985 is located from position 52745273 to position 52745386 relative to chromosome 20 on the `+` strand.

GAM4821 precursor RNA folds onto itself, forming GAM4821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4821 precursor RNA, designated SEQ ID NO: 6985, and a schematic representation of a predicted secondary folding of GAM4821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4821 folded precursor RNA yielding a GAM4821 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM4821 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4821 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM4821 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4821 target RNA, herein designated GAM TARGET RNA. GAM4821 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4821 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4821 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4821 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4821 RNA, herein designated GAM RNA, to target binding sites on GAM4821 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4821 target RNA into GAM4821 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4821 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4821 target genes. The mRNA of each one of this plurality of GAM4821 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4821 RNA, herein designated GAM RNA, and which when bound by GAM4821 RNA causes inhibition of translation of the GAM4821 target mRNA into a corresponding GAM4821 target protein.

The mechanism of the translational inhibition exerted by GAM4821 RNA, herein designated GAM RNA, on one or more GAM4821 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4821 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4821 RNA, herein designated GAM RNA, of GAM4821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4821 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4821 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4821 RNA correlate with, and may be deduced from, the identity of the GAM4821 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTCATAACTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AATATATTAA Messenger 4844 (GAM4844) oligonucleotides modulates expression of respective target genes

AAACTTAAAT whose function and utility is known in the art.

TGTATACTTT GAM4844 is a novel bioinformatically detectable regulatory, non protein coding,

AAGTTGGTGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4844 was detected is

TTGTATGATA described with additional reference to Figs. 9-15.

TATGAGTTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATCAATA encoded by the human genome.

GAM4844 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4844 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4844 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4844 precursor RNA is designated SEQ ID:7281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7281 is located from position 15101510 to position 15101596 relative to chromosome 16 on the `-` strand.

GAM4844 precursor RNA folds onto itself, forming GAM4844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4844 precursor RNA, designated SEQ ID NO: 7281, and a schematic representation of a predicted secondary folding of GAM4844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4844 folded precursor RNA yielding a GAM4844 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4844 RNA, hereby incorporated herein.

GAM4844 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4844 target RNA, herein designated GAM TARGET RNA. GAM4844 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4844 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4844 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4844 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4844 RNA, herein designated GAM RNA, to target binding sites on GAM4844 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4844 target RNA into GAM4844 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4844 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4844 target genes. The mRNA of each one of this plurality of GAM4844 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4844 RNA, herein designated GAM RNA, and which when bound by GAM4844 RNA causes inhibition of translation of the GAM4844 target mRNA into a corresponding GAM4844 target protein.

The mechanism of the translational inhibition exerted by GAM4844 RNA, herein designated GAM RNA, on one or more GAM4844 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4844 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4844 RNA, herein designated GAM RNA, of GAM4844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4844 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4844 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4844 RNA correlate with, and may be deduced from, the identity of the GAM4844 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4895 6171 CTCGTGGCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCTCTCCCT Messenger 4895 (GAM4895) oligonucleotides modulates expression of respective target genes
CTCCCTCCTC whose function and utility is known in the art.

CAGGCCACGG GAM4895 is a novel bioinformatically detectable regulatory, non protein coding,
ATTTCATGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4895 was detected is

CCTGTGACTG described with additional reference to Figs. 9-15.

GTGGGGCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGAGGAGAC encoded by the human genome.

AGGAAGCCTC GAM4895 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4895

AAGTTCCAGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4895

GCAGAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4895 precursor RNA is designated SEQ ID:6171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6171 is located from position 119323982 to position 119324097 relative to chromosome 11 on the `-` strand.

GAM4895 precursor RNA folds onto itself, forming GAM4895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4895 precursor RNA, designated SEQ ID NO: 6171, and a schematic representation of a predicted secondary folding of GAM4895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4895 folded precursor RNA yielding a GAM4895 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4895 RNA, hereby incorporated herein.

GAM4895 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4895 target RNA, herein designated GAM TARGET RNA. GAM4895 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4895 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4895 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4895 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4895 RNA, herein designated GAM RNA, to target binding sites on GAM4895 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4895 target RNA into GAM4895 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4895 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4895 target genes. The mRNA of each one of this plurality of GAM4895 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4895 RNA, herein designated GAM RNA, and which when bound by GAM4895 RNA causes inhibition of translation of the GAM4895 target mRNA into a corresponding GAM4895 target protein.

The mechanism of the translational inhibition exerted by GAM4895 RNA, herein designated GAM RNA, on one or more GAM4895 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4895 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4895 RNA, herein designated GAM RNA, of GAM4895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4895 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4895 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4895 RNA correlate with, and may be deduced from, the identity of the GAM4895 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GCAGGATGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCTCCTGAGG Messenger 4904 (GAM4904) oligonucleotides modulates expression of respective target genes

TGTGTCGAGT whose function and utility is known in the art.

GTTCTCTACA TGGGGCACTG TGGAGGTGTC ATCGGCTCAG TTCCCC GAM4904 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM4904 was detected is described with additional reference to Figs. 9-15. GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM4904 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4904 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4904 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4904 precursor RNA is designated SEQ ID:6847, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6847 is located from position 118036640 to position 118036725 relative to chromosome 9 on the `-` strand.

GAM4904 precursor RNA folds onto itself, forming GAM4904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4904 precursor RNA, designated SEQ ID NO: 6847, and a schematic representation of a predicted secondary folding of GAM4904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4904 folded precursor RNA yielding a GAM4904 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4904 RNA, hereby incorporated herein.

GAM4904 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4904 target RNA, herein designated GAM TARGET RNA. GAM4904 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4904 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4904 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4904 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4904 RNA, herein designated GAM RNA, to target binding sites on GAM4904 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4904 target RNA into GAM4904 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4904 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4904 target genes. The mRNA of each one of this plurality of GAM4904 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4904 RNA, herein designated GAM RNA, and which when bound by GAM4904 RNA causes inhibition of translation of the GAM4904 target mRNA into a corresponding GAM4904 target protein.

The mechanism of the translational inhibition exerted by GAM4904 RNA, herein designated GAM RNA, on one or more GAM4904 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4904 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4904 RNA, herein designated GAM RNA, of GAM4904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4904 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4904 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4904 RNA correlate with, and may be deduced from, the identity of the GAM4904 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4913 5654 AAATCTCTCA Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCACTGCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTTTTAAAA Messenger 4913 (GAM4913) oligonucleotides modulates expression of respective target genes

GTCTGGCGCA whose function and utility is known in the art.

TCTTGACTTT GAM4913 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTTCACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4913 was detected is

ATAACAGCCA described with additional reference to Figs. 9-15.

GCTTGGATTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATTTGAGAGA encoded by the human genome.

TTT GAM4913 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4913 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4913 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4913 precursor RNA is designated SEQ ID:5654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5654 is located from position 52918008 to position 52918100 relative to chromosome 18 on the `+` strand.

GAM4913 precursor RNA folds onto itself, forming GAM4913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4913 precursor RNA, designated SEQ ID NO: 5654, and a schematic representation of a predicted secondary folding of GAM4913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4913 folded precursor RNA yielding a GAM4913 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4913 RNA, hereby incorporated herein.

GAM4913 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4913 target RNA, herein designated GAM TARGET RNA. GAM4913 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4913 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4913 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4913 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4913 RNA, herein designated GAM RNA, to target binding sites on GAM4913 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4913 target RNA into GAM4913 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4913 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4913 target genes. The mRNA of each one of this plurality of GAM4913 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4913 RNA, herein designated GAM RNA, and which when bound by GAM4913 RNA causes inhibition of translation of the GAM4913 target mRNA into a corresponding GAM4913 target protein.

The mechanism of the translational inhibition exerted by GAM4913 RNA, herein designated GAM RNA, on one or more GAM4913 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4913 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4913 RNA, herein designated GAM RNA, of GAM4913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4913 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4913 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4913 RNA correlate with, and may be deduced from, the identity of the GAM4913 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4932 7273 TGTGGAGAAT Fig. 8 further provides a conceptual description of another novel bioinformatically
TAAAAAGGGT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGTGAGGCTG Messenger 4932 (GAM4932) oligonucleotides modulates expression of respective target genes
GCATTTATAG whose function and utility is known in the art.

AATCTGGCTT GAM4932 is a novel bioinformatically detectable regulatory, non protein coding,
TCTTGTATTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM4932 was detected is

GGTGGAAAGC described with additional reference to Figs. 9-15.

TAGATGAAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGTTTCTCT encoded by the human genome.

CAGCCTTTTC GAM4932 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4932
TCTCCTCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4932

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4932 precursor RNA is designated SEQ ID:7273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7273 is located from position 116757833 to position 116757940 relative to chromosome 9 on the `-` strand.

GAM4932 precursor RNA folds onto itself, forming GAM4932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4932 precursor RNA, designated SEQ ID NO: 7273, and a schematic representation of a predicted secondary folding of GAM4932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4932 folded precursor RNA yielding a GAM4932 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4932 RNA, hereby incorporated herein.

GAM4932 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4932 target RNA, herein designated GAM TARGET RNA. GAM4932 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4932 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4932 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4932 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4932 RNA, herein designated GAM RNA, to target binding sites on GAM4932 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4932 target RNA into GAM4932 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4932 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4932 target genes. The mRNA of each one of this plurality of GAM4932 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4932 RNA, herein designated GAM RNA, and which when bound by GAM4932 RNA causes inhibition of translation of the GAM4932 target mRNA into a corresponding GAM4932 target protein.

The mechanism of the translational inhibition exerted by GAM4932 RNA, herein designated GAM RNA, on one or more GAM4932 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4932 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4932 RNA, herein designated GAM RNA, of GAM4932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM4932 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4932 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4932 RNA correlate with, and may be deduced from, the identity of the GAM4932 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4946 6977 TAGTGAGATG Fig. 8 further provides a conceptual description of another novel bioinformatically
AACCCGGTAC detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCAGATGGA Messenger 4946 (GAM4946) oligonucleotides modulates expression of respective target genes

TCGCCTGTCT GAM4946 is a novel bioinformatically detectable regulatory, non protein coding,
TCTGCGTCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM4946 was detected is

TCACGCTGGG described with additional reference to Figs. 9-15.

AGCTGTAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGGAGCTGTT encoded by the human genome.

CCTATTTGGC GAM4946 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4946
CATCTTGGCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4946
CCTCTCTCCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CTG to the nucleotide sequence of GAM4946 precursor RNA is designated SEQ ID:6977, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6977 is located from position 129644 to position 129766 relative to chromosome 9 on the `-` strand.

GAM4946 precursor RNA folds onto itself, forming GAM4946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4946 precursor RNA, designated SEQ ID NO: 6977, and a schematic representation of a predicted secondary folding of GAM4946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4946 folded precursor RNA yielding a GAM4946 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4946 RNA, hereby incorporated herein.

GAM4946 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4946 target RNA, herein designated GAM TARGET RNA. GAM4946 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4946 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4946 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4946 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4946 RNA, herein designated GAM RNA, to target binding sites on GAM4946 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4946 target RNA into GAM4946 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4946 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4946 target genes. The mRNA of each one of this plurality of GAM4946 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4946 RNA, herein designated GAM RNA, and which when bound by GAM4946 RNA causes inhibition of translation of the GAM4946 target mRNA into a corresponding GAM4946 target protein.

The mechanism of the translational inhibition exerted by GAM4946 RNA, herein designated GAM RNA, on one or more GAM4946 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4946 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4946 RNA, herein designated GAM RNA, of

GAM4946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4946 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4946 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4946 RNA correlate with, and may be deduced from, the identity of the GAM4946 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAATCCTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTTCAGGTG Messenger 4969 (GAM4969) oligonucleotides modulates expression of respective target genes

GCTCCAAAAA whose function and utility is known in the art.

GAATGTTGCA GAM4969 is a novel bioinformatically detectable regulatory, non protein coding,

TGTGTTCAGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4969 was detected is

CCATCCTGAG described with additional reference to Figs. 9-15.

CAGAGCCACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAATTTAGTG encoded by the human genome.

ACAGTGTCTA GAM4969 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4969

GC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4969

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4969 precursor RNA is designated SEQ ID:6546, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6546 is located from position 43463077 to position 43463178 relative to chromosome 20 on the `-` strand.

GAM4969 precursor RNA folds onto itself, forming GAM4969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4969 precursor RNA, designated SEQ ID NO: 6546, and a schematic representation of a predicted secondary folding of GAM4969 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4969 folded precursor RNA yielding a GAM4969 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4969 RNA, hereby incorporated herein.

GAM4969 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4969 target RNA, herein designated GAM TARGET RNA. GAM4969 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4969 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4969 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4969 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4969 RNA, herein designated GAM RNA, to target binding sites on GAM4969 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4969 target RNA into GAM4969 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4969 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4969 target genes. The mRNA of each one of this plurality of GAM4969 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4969 RNA, herein designated GAM RNA, and which when bound by GAM4969 RNA causes inhibition of translation of the GAM4969 target mRNA into a corresponding GAM4969 target protein.

The mechanism of the translational inhibition exerted by GAM4969 RNA, herein designated GAM RNA, on one or more GAM4969 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4969 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM4969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4969 RNA, herein designated GAM RNA, of GAM4969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4969 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4969 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4969 RNA correlate with, and may be deduced from, the identity of the GAM4969 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4971 7020 TCCAGACACT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCTTCCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTTCAGGGA Messenger 4971 (GAM4971) oligonucleotides modulates expression of respective target genes

ACCCTCAATA whose function and utility is known in the art.

CACAGTAAGA GAM4971 is a novel bioinformatically detectable regulatory, non protein coding,

ATGAAGAGGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4971 was detected is

TGCAGGTCTG described with additional reference to Figs. 9-15.

AGCTTGAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGACTGGA encoded by the human genome.

GAM4971 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4971

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4971

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4971 precursor RNA is designated SEQ ID:7020, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7020 is located from position 37937921 to position 37938008 relative to chromosome 15 on the `+` strand.

GAM4971 precursor RNA folds onto itself, forming GAM4971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4971 precursor RNA, designated SEQ ID NO: 7020, and a schematic representation of a predicted secondary folding of GAM4971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4971 folded precursor RNA yielding a GAM4971 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4971 RNA, hereby incorporated herein.

GAM4971 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4971 target RNA, herein designated GAM TARGET RNA. GAM4971 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4971 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4971 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4971 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4971 RNA, herein designated GAM RNA, to target binding sites on GAM4971 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4971 target RNA into GAM4971 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4971 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4971 target genes. The mRNA of each one of this plurality of GAM4971 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4971 RNA, herein designated GAM RNA, and which when bound by GAM4971 RNA causes inhibition of translation of the GAM4971 target mRNA into a corresponding GAM4971 target protein.

The mechanism of the translational inhibition exerted by GAM4971 RNA, herein designated GAM RNA, on one or more GAM4971 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4971 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4971 RNA, herein designated GAM RNA, of GAM4971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4971 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4971 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4971 RNA correlate with, and may be deduced from, the identity of the GAM4971 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4975 6048 CCACAGTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTGCCCGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGGGTCCCA Messenger 4975 (GAM4975) oligonucleotides modulates expression of respective target genes

CTGGGGAAGC whose function and utility is known in the art.

TCAAGGCAGC GAM4975 is a novel bioinformatically detectable regulatory, non protein coding,

CCTGGCCTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM4975 was detected is

CCCTCATTCT described with additional reference to Figs. 9-15.

CCACCCAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGGCCCCTGC encoded by the human genome.

GTGG GAM4975 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4975

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4975

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM4975 precursor RNA is designated SEQ ID:6048, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6048 is located from position 142992769 to position 142992862 relative to chromosome 8 on the `+` strand.

GAM4975 precursor RNA folds onto itself, forming GAM4975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4975 precursor RNA, designated SEQ ID NO: 6048, and a schematic representation of a predicted secondary folding of GAM4975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4975 folded precursor RNA yielding a GAM4975 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4975 RNA, hereby incorporated herein.

GAM4975 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4975 target RNA, herein designated GAM TARGET RNA. GAM4975 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4975 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4975 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4975 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4975 RNA, herein designated GAM RNA, to target binding sites on GAM4975 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4975 target RNA into GAM4975 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM4975 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4975 target genes. The mRNA of each one of this plurality of GAM4975 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4975 RNA, herein

designated GAM RNA, and which when bound by GAM4975 RNA causes inhibition of translation of the GAM4975 target mRNA into a corresponding GAM4975 target protein.

The mechanism of the translational inhibition exerted by GAM4975 RNA, herein designated GAM RNA, on one or more GAM4975 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4975 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4975 RNA, herein designated GAM RNA, of GAM4975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4975 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4975 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4975 RNA correlate with, and may be deduced from, the identity of the GAM4975 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM4986 6036 CATCAAAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
TAAATAAGCT detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTCTAATTG Messenger 4986 (GAM4986) oligonucleotides modulates expression of respective target genes
CCAAGAATTC whose function and utility is known in the art.

ACATGTGGTT GAM4986 is a novel bioinformatically detectable regulatory, non protein coding,
GTATGCAGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM4986 was detected is

TTACTGGGAA described with additional reference to Figs. 9-15.

ATTGAAGTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATCTGCATGT encoded by the human genome.

GATTCTGCTG GAM4986 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM4986
TGATGGACAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM4986

TTGTAAGTTT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar GTTCCTGGAG to the nucleotide sequence of GAM4986 precursor RNA is designated SEQ ID:6036, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6036 is located from position 43025631 to position 43025760 relative to chromosome 9 on the `-` strand.

GAM4986 precursor RNA folds onto itself, forming GAM4986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM4986 precursor RNA, designated SEQ ID NO: 6036, and a schematic representation of a predicted secondary folding of GAM4986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM4986 folded precursor RNA yielding a GAM4986 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM4986 RNA, hereby incorporated herein.

GAM4986 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM4986 target RNA, herein designated GAM TARGET RNA. GAM4986 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM4986 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM4986 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM4986 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM4986 RNA, herein designated GAM RNA, to target binding sites on GAM4986 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM4986 target RNA into GAM4986 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM4986 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM4986 target genes. The mRNA of each one of this plurality of GAM4986 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM4986 RNA, herein designated GAM RNA, and which when bound by GAM4986 RNA causes inhibition of translation of the GAM4986 target mRNA into a corresponding GAM4986 target protein.

The mechanism of the translational inhibition exerted by GAM4986 RNA, herein designated GAM RNA, on one or more GAM4986 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM4986 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM4986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM4986 RNA, herein designated GAM RNA, of GAM4986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM4986 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM4986 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM4986 RNA correlate with, and may be deduced from, the identity of the GAM4986 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5000 6573 GGAAACTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTGCCTCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

CATTTTAGGT Messenger 5008 (GAM5008) oligonucleotides modulates expression of respective target genes

TCTGATAGCT whose function and utility is known in the art.

GTATTCTCAG GAM5008 is a novel bioinformatically detectable regulatory, non protein coding,

TCCTGGAGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5008 was detected is

ACAGGTGTAG described with additional reference to Figs. 9-15.

CCTGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM5008 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5008 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5008 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5008 precursor RNA is designated SEQ ID:6211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6211 is located from position 54394162 to position 54394238 relative to chromosome 19 on the `+` strand.

GAM5008 precursor RNA folds onto itself, forming GAM5008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5008 precursor RNA, designated SEQ ID NO: 6211, and a schematic representation of a predicted secondary folding of GAM5008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5008 folded precursor RNA yielding a GAM5008 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5008 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5008 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5008 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5008 target RNA, herein designated GAM TARGET RNA. GAM5008 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5008 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5008 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5008 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5008 RNA, herein designated GAM RNA, to target binding sites on GAM5008 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5008 target RNA into GAM5008 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5008 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5008 target genes. The mRNA of each one of this plurality of GAM5008 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5008 RNA, herein designated GAM RNA, and which when bound by GAM5008 RNA causes inhibition of translation of the GAM5008 target mRNA into a corresponding GAM5008 target protein.

The mechanism of the translational inhibition exerted by GAM5008 RNA, herein designated GAM RNA, on one or more GAM5008 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5008 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5008 RNA, herein designated GAM RNA, of GAM5008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5008 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5008 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5008 RNA correlate with, and may be deduced from, the identity of the GAM5008 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5011 6892 GTCTTCATAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCCAGGTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCTGGAGCA Messenger 5011 (GAM5011) oligonucleotides modulates expression of respective target genes

ATTACCTCCC whose function and utility is known in the art.

CCATCTGGCT CCTTAGGACC TAGAGGTAGT AAAGGC GAM5011 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM5011 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM5011 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5011 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5011 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5011 precursor RNA is designated SEQ ID:6892, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6892 is located from position 45580563 to position 45580638 relative to chromosome 15 on the `+` strand.

GAM5011 precursor RNA folds onto itself, forming GAM5011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5011 precursor RNA, designated SEQ ID NO: 6892, and a schematic representation of a predicted secondary folding of GAM5011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5011 folded precursor RNA yielding a GAM5011 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5011 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5011 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5011 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5011 target RNA, herein designated GAM TARGET RNA. GAM5011 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5011 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM5011 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5011 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5011 RNA, herein designated GAM RNA, to target binding sites on GAM5011 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5011 target RNA into GAM5011 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5011 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5011 target genes. The mRNA of each one of this plurality of GAM5011 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5011 RNA, herein designated GAM RNA, and which when bound by GAM5011 RNA causes inhibition of translation of the GAM5011 target mRNA into a corresponding GAM5011 target protein.

The mechanism of the translational inhibition exerted by GAM5011 RNA, herein designated GAM RNA, on one or more GAM5011 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5011 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5011 RNA, herein designated GAM RNA, of GAM5011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5011 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5011 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5011 RNA correlate with, and may be deduced from, the identity of the GAM5011 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5035 6875 GTCCACTGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTTCTTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTAGGTCCTC Messenger 5035 (GAM5035) oligonucleotides modulates expression of respective target genes

ACACACAGCT whose function and utility is known in the art.

CTGCTCAGTT GAM5035 is a novel bioinformatically detectable regulatory, non protein coding,

CAATCACCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5035 was detected is

GAATGCAGGC described with additional reference to Figs. 9-15.

TGGTTGGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCAAATTTG encoded by the human genome.

GACAGAAGAA GAM5035 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5035

GTCAGTGTCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5035

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5035 precursor RNA is designated SEQ ID:6875, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6875 is located from position 71813551 to position 71813660 relative to chromosome 9 on the `+` strand.

GAM5035 precursor RNA folds onto itself, forming GAM5035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5035 precursor RNA, designated SEQ ID NO: 6875, and a schematic representation of a predicted secondary folding of GAM5035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5035 folded precursor RNA yielding a GAM5035 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5035 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5035 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5035 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5035 target RNA, herein designated GAM TARGET RNA. GAM5035 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5035 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5035 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5035 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5035 RNA, herein designated GAM RNA, to target binding sites on GAM5035 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5035 target RNA into GAM5035 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5035 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5035 target genes. The mRNA of each one of this plurality of GAM5035 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5035 RNA, herein designated GAM RNA, and which when bound by GAM5035 RNA causes inhibition of translation of the GAM5035 target mRNA into a corresponding GAM5035 target protein.

The mechanism of the translational inhibition exerted by GAM5035 RNA, herein designated GAM RNA, on one or more GAM5035 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5035 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5035 RNA, herein designated GAM RNA, of GAM5035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5035 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5035 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5035 RNA correlate with, and may be deduced from, the identity of the GAM5035 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5048 6565 GCTTGCTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTACAGATG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCAAAGATCT Messenger 5048 (GAM5048) oligonucleotides modulates expression of respective target genes

GGCAAATTAA whose function and utility is known in the art.

AAATAGCCTT GAM5048 is a novel bioinformatically detectable regulatory, non protein coding,

AGGCCAAAGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5048 was detected is

TCAAACCCAA described with additional reference to Figs. 9-15.

GGTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5048 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5048

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5048

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5048 precursor RNA is designated SEQ ID:6565, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6565 is located from position 118768043 to position 118768119 relative to chromosome 12 on the `+` strand.

GAM5048 precursor RNA folds onto itself, forming GAM5048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5048 precursor RNA, designated SEQ ID NO: 6565, and a schematic representation of a predicted secondary folding of GAM5048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5048 folded precursor RNA yielding a GAM5048 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM5048 RNA, hereby incorporated herein.

GAM5048 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5048 target RNA, herein designated GAM TARGET RNA. GAM5048 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5048 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5048 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5048 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5048 RNA, herein designated GAM RNA, to target binding sites on GAM5048 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5048 target RNA into GAM5048 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5048 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5048 target genes. The mRNA of each one of this plurality of GAM5048 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5048 RNA, herein designated GAM RNA, and which when bound by GAM5048 RNA causes inhibition of translation of the GAM5048 target mRNA into a corresponding GAM5048 target protein.

The mechanism of the translational inhibition exerted by GAM5048 RNA, herein designated GAM RNA, on one or more GAM5048 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5048 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5048 RNA, herein designated GAM RNA, of GAM5048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5048 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5048 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5048 RNA correlate with, and may be deduced from, the identity of the GAM5048 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5058 6700 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAATCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCAGAGG Messenger 5058 (GAM5058) oligonucleotides modulates expression of respective target genes
TTGCAGTGAG whose function and utility is known in the art.

CTGAGATCAT GAM5058 is a novel bioinformatically detectable regulatory, non protein coding,
GCCACTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5058 was detected is

TCCAGCCTGG described with additional reference to Figs. 9-15.

GTGACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GACACTCC encoded by the human genome.

GAM5058 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5058

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5058
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5058 precursor RNA is designated SEQ ID:6700, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6700 is located from position 122025582 to position 122025669 relative to chromosome 12 on the `+` strand.

GAM5058 precursor RNA folds onto itself, forming GAM5058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5058 precursor RNA, designated SEQ ID NO: 6700, and a schematic representation of a predicted secondary folding of GAM5058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5058 folded precursor RNA

yielding a GAM5058 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5058 RNA, hereby incorporated herein.

GAM5058 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5058 target RNA, herein designated GAM TARGET RNA. GAM5058 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5058 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5058 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5058 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5058 RNA, herein designated GAM RNA, to target binding sites on GAM5058 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5058 target RNA into GAM5058 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5058 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5058 target genes. The mRNA of each one of this plurality of GAM5058 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5058 RNA, herein designated GAM RNA, and which when bound by GAM5058 RNA causes inhibition of translation of the GAM5058 target mRNA into a corresponding GAM5058 target protein.

The mechanism of the translational inhibition exerted by GAM5058 RNA, herein designated GAM RNA, on one or more GAM5058 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5058 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5058 RNA, herein designated GAM RNA, of GAM5058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5058 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5058 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5058 RNA correlate with, and may be deduced from, the identity of the GAM5058 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5082 6833 GGTATACTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTAGCATATT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATATAGCTCT Messenger 5082 (GAM5082) oligonucleotides modulates expression of respective target genes

AAGAGTGTAG whose function and utility is known in the art.

AGTTATATGA GAM5082 is a novel bioinformatically detectable regulatory, non protein coding,

TGTGCTAGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5082 was detected is

AAGTGTATT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5082 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5082

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5082

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5082 precursor RNA is designated SEQ ID:6833, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6833 is located from position 101882283 to position 101882351 relative to chromosome 8 on the `+` strand.

GAM5082 precursor RNA folds onto itself, forming GAM5082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5082 precursor RNA, designated SEQ ID NO: 6833, and a

schematic representation of a predicted secondary folding of GAM5082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5082 folded precursor RNA yielding a GAM5082 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5082 RNA, hereby incorporated herein.

GAM5082 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5082 target RNA, herein designated GAM TARGET RNA. GAM5082 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5082 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5082 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5082 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5082 RNA, herein designated GAM RNA, to target binding sites on GAM5082 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5082 target RNA into GAM5082 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5082 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5082 target genes. The mRNA of each one of this plurality of GAM5082 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5082 RNA, herein designated GAM RNA, and which when bound by GAM5082 RNA causes inhibition of translation of the GAM5082 target mRNA into a corresponding GAM5082 target protein.

The mechanism of the translational inhibition exerted by GAM5082 RNA, herein designated GAM RNA, on one or more GAM5082 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5082 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5082 RNA, herein designated GAM RNA, of GAM5082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5082 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5082 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5082 RNA correlate with, and may be deduced from, the identity of the GAM5082 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5085 6779 GGGACATCAA Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAATAAATA detected oligonucleotides of the present invention, referred to here as Genomic Address
AGCTGCTCTA Messenger 5085 (GAM5085) oligonucleotides modulates expression of respective target genes
ATTGCCAAGA whose function and utility is known in the art.

ATTCACATGT GAM5085 is a novel bioinformatically detectable regulatory, non protein coding,
GGTTGTATGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5085 was detected is

AGCATTACTG described with additional reference to Figs. 9-15.

GGAAATTGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTGTATCTGC encoded by the human genome.

ATGTGATTCT GAM5085 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5085
GCTGTGATGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5085
ACACTTGTAA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
GTTTGTTCC to the nucleotide sequence of GAM5085 precursor RNA is designated SEQ ID:6779, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6779 is located from position 43025636 to position 43025764 relative to chromosome 9 on the `-` strand.

GAM5085 precursor RNA folds onto itself, forming GAM5085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5085 precursor RNA, designated SEQ ID NO: 6779, and a schematic representation of a predicted secondary folding of GAM5085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5085 folded precursor RNA yielding a GAM5085 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5085 RNA, hereby incorporated herein.

GAM5085 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5085 target RNA, herein designated GAM TARGET RNA. GAM5085 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5085 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5085 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5085 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5085 RNA, herein designated GAM RNA, to target binding sites on GAM5085 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5085 target RNA into GAM5085 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5085 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5085 target genes. The mRNA of each one of this plurality of GAM5085 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5085 RNA, herein designated GAM RNA, and which when bound by GAM5085 RNA causes inhibition of translation of the GAM5085 target mRNA into a corresponding GAM5085 target protein.

The mechanism of the translational inhibition exerted by GAM5085 RNA, herein designated GAM RNA, on one or more GAM5085 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5085 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5085 RNA, herein designated GAM RNA, of GAM5085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5085 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5085 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5085 RNA correlate with, and may be deduced from, the identity of the GAM5085 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5090 6215 CTGCCCCCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTCTGGACC detected oligonucleotides of the present invention, referred to here as Genomic Address

CGAGTGACTC Messenger 5090 (GAM5090) oligonucleotides modulates expression of respective target genes

AGGCCTTTGT whose function and utility is known in the art.

TTGTCCTTCC GAM5090 is a novel bioinformatically detectable regulatory, non protein coding,

TGGTAGAGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5090 was detected is

GGGTTCCCTC described with additional reference to Figs. 9-15.

CCTCGGCAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATGCCGGAGT encoded by the human genome.

GCTGGGATGG GAM5090 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5090

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5090

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5090 precursor RNA is designated SEQ ID:6215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:6215 is located from position 58268693 to position 58268792 relative to chromosome 16 on the `+` strand.

GAM5090 precursor RNA folds onto itself, forming GAM5090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5090 precursor RNA, designated SEQ ID NO: 6215, and a schematic representation of a predicted secondary folding of GAM5090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5090 folded precursor RNA yielding a GAM5090 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5090 RNA, hereby incorporated herein.

GAM5090 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5090 target RNA, herein designated GAM TARGET RNA. GAM5090 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5090 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5090 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5090 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5090 RNA, herein designated GAM RNA, to target binding sites on GAM5090 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5090 target RNA into GAM5090 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5090 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5090 target genes. The mRNA of each one of this

plurality of GAM5090 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5090 RNA, herein designated GAM RNA, and which when bound by GAM5090 RNA causes inhibition of translation of the GAM5090 target mRNA into a corresponding GAM5090 target protein.

The mechanism of the translational inhibition exerted by GAM5090 RNA, herein designated GAM RNA, on one or more GAM5090 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5090 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5090 RNA, herein designated GAM RNA, of GAM5090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5090 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5090 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5090 RNA correlate with, and may be deduced from, the identity of the GAM5090 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5127 6789 GGGAGGAGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGGAACCAT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGATTCTGAG Messenger 5127 (GAM5127) oligonucleotides modulates expression of respective target genes
AAACACACCA whose function and utility is known in the art.

GGATGACTAG GAM5127 is a novel bioinformatically detectable regulatory, non protein coding,
GCCTGGAGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5127 was detected is

GTCCAGGGTG described with additional reference to Figs. 9-15.

GGCCTCAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTCACTTCT encoded by the human genome.

TGTCTGGCAC GAM5127 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5127

CTCCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5127 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5127 precursor RNA is designated SEQ ID:6789, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6789 is located from position 43743986 to position 43744090 relative to chromosome 13 on the `+` strand.

GAM5127 precursor RNA folds onto itself, forming GAM5127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5127 precursor RNA, designated SEQ ID NO: 6789, and a schematic representation of a predicted secondary folding of GAM5127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5127 folded precursor RNA yielding a GAM5127 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5127 RNA, hereby incorporated herein.

GAM5127 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5127 target RNA, herein designated GAM TARGET RNA. GAM5127 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5127 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5127 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5127 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5127 RNA, herein designated GAM RNA, to target binding sites on GAM5127 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5127 target RNA

into GAM5127 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5127 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5127 target genes. The mRNA of each one of this plurality of GAM5127 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5127 RNA, herein designated GAM RNA, and which when bound by GAM5127 RNA causes inhibition of translation of the GAM5127 target mRNA into a corresponding GAM5127 target protein.

The mechanism of the translational inhibition exerted by GAM5127 RNA, herein designated GAM RNA, on one or more GAM5127 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5127 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5127 RNA, herein designated GAM RNA, of GAM5127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5127 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5127 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5127 RNA correlate with, and may be deduced from, the identity of the GAM5127 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5142 5806 AGTCTCACTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTCACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTGGAGTGC Messenger 5142 (GAM5142) oligonucleotides modulates expression of respective target genes
AGTGGCATGA whose function and utility is known in the art.

TCTTGGTTCA GAM5142 is a novel bioinformatically detectable regulatory, non protein coding,
CTGCAACCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5142 was detected is

TGCTTCTGGG described with additional reference to Figs. 9-15.

ATTCAAGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TT encoded by the human genome.

GAM5142 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5142 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5142 precursor RNA is designated SEQ ID:5806, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5806 is located from position 4104693 to position 4104774 relative to chromosome 20 on the `+` strand.

GAM5142 precursor RNA folds onto itself, forming GAM5142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5142 precursor RNA, designated SEQ ID NO: 5806, and a schematic representation of a predicted secondary folding of GAM5142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5142 folded precursor RNA yielding a GAM5142 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5142 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5142 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5142 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5142 target RNA, herein designated GAM TARGET RNA. GAM5142 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5142 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5142 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5142 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5142 RNA, herein designated GAM RNA, to target binding sites on GAM5142 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5142 target RNA into GAM5142 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5142 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5142 target genes. The mRNA of each one of this plurality of GAM5142 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5142 RNA, herein designated GAM RNA, and which when bound by GAM5142 RNA causes inhibition of translation of the GAM5142 target mRNA into a corresponding GAM5142 target protein.

The mechanism of the translational inhibition exerted by GAM5142 RNA, herein designated GAM RNA, on one or more GAM5142 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5142 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5142 RNA, herein designated GAM RNA, of GAM5142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5142 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5142 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5142 RNA correlate with, and may be deduced from, the identity of the GAM5142 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5209 6580 GGAAGCCTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTTACCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCTGGTTGA Messenger 5209 (GAM5209) oligonucleotides modulates expression of respective target genes

GGGCCCCCTG whose function and utility is known in the art.

GGCTGTTTTC GAM5209 is a novel bioinformatically detectable regulatory, non protein coding,

ACTGGTTGAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5209 was detected is

GGTATCTGAT described with additional reference to Figs. 9-15.

CCCTTCCAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGAGGTTCC encoded by the human genome.

TGGAGGGCCA GAM5209 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5209

GTCCAGGTCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5209

GAGGTCTGGT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TCATGCTTCC to the nucleotide sequence of GAM5209 precursor RNA is designated SEQ ID:6580, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6580 is located from position 72669608 to position 72669737 relative to chromosome 11 on the `-` strand.

GAM5209 precursor RNA folds onto itself, forming GAM5209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5209 precursor RNA, designated SEQ ID NO: 6580, and a schematic representation of a predicted secondary folding of GAM5209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5209 folded precursor RNA yielding a GAM5209 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5209 RNA, hereby incorporated herein.

GAM5209 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5209 target RNA, herein designated GAM TARGET RNA. GAM5209 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5209 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5209 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM5209 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5209 RNA, herein designated GAM RNA, to target binding sites on GAM5209 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5209 target RNA into GAM5209 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5209 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5209 target genes. The mRNA of each one of this plurality of GAM5209 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5209 RNA, herein designated GAM RNA, and which when bound by GAM5209 RNA causes inhibition of translation of the GAM5209 target mRNA into a corresponding GAM5209 target protein.

The mechanism of the translational inhibition exerted by GAM5209 RNA, herein designated GAM RNA, on one or more GAM5209 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5209 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5209 RNA, herein designated GAM RNA, of GAM5209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5209 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5209 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5209 RNA correlate with, and may be deduced from, the identity of the GAM5209 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5217 5686 ACACTGGACA Fig. 8 further provides a conceptual description of another novel bioinformatically

GATGGATGTT detected oligonucleotides of the present invention, referred to here as Genomic Address
GATGAGCTTG Messenger 5217 (GAM5217) oligonucleotides modulates expression of respective target genes
TGTGCAGCAG whose function and utility is known in the art.

TTCTACTGGA GAM5217 is a novel bioinformatically detectable regulatory, non protein coding,
AGTATGTACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5217 was detected is

AGGGGCTCAG described with additional reference to Figs. 9-15.

CCAGCCAATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGACGGTGT encoded by the human genome.

GAM5217 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5217

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5217

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5217 precursor RNA is designated SEQ ID:5686, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5686 is located from position 22848134 to position 22848223 relative to chromosome 7 on the `-` strand.

GAM5217 precursor RNA folds onto itself, forming GAM5217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5217 precursor RNA, designated SEQ ID NO: 5686, and a schematic representation of a predicted secondary folding of GAM5217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5217 folded precursor RNA yielding a GAM5217 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5217 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5217 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5217 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5217 target RNA, herein designated GAM TARGET RNA. GAM5217 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

GAM5217 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5217 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5217 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5217 RNA, herein designated GAM RNA, to target binding sites on GAM5217 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5217 target RNA into GAM5217 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5217 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5217 target genes. The mRNA of each one of this plurality of GAM5217 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5217 RNA, herein designated GAM RNA, and which when bound by GAM5217 RNA causes inhibition of translation of the GAM5217 target mRNA into a corresponding GAM5217 target protein.

The mechanism of the translational inhibition exerted by GAM5217 RNA, herein designated GAM RNA, on one or more GAM5217 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5217 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5217 RNA, herein designated GAM RNA, of GAM5217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5217 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5217 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5217 RNA

correlate with, and may be deduced from, the identity of the GAM5217 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5222 5953 ATATGCTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGGGACAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGCTAAGGAT Messenger 5222 (GAM5222) oligonucleotides modulates expression of respective target genes
AGAGGTGAGG whose function and utility is known in the art.

AAACCCGCAG GAM5222 is a novel bioinformatically detectable regulatory, non protein coding,
ACAACAGCGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5222 was detected is

CATGCTCCTC described with additional reference to Figs. 9-15.

ATCTTTGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCCAGCGAAC encoded by the human genome.

CTTTCCACTG GAM5222 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5222
TGTGTGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5222

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5222 precursor RNA is designated SEQ ID:5953, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5953 is located from position 34060088 to position 34060194 relative to chromosome 17 on the `+` strand.

GAM5222 precursor RNA folds onto itself, forming GAM5222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5222 precursor RNA, designated SEQ ID NO: 5953, and a schematic representation of a predicted secondary folding of GAM5222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5222 folded precursor RNA yielding a GAM5222 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5222 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5222 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5222 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5222 target RNA, herein designated GAM TARGET RNA. GAM5222 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5222 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5222 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5222 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5222 RNA, herein designated GAM RNA, to target binding sites on GAM5222 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5222 target RNA into GAM5222 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5222 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5222 target genes. The mRNA of each one of this plurality of GAM5222 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5222 RNA, herein designated GAM RNA, and which when bound by GAM5222 RNA causes inhibition of translation of the GAM5222 target mRNA into a corresponding GAM5222 target protein.

The mechanism of the translational inhibition exerted by GAM5222 RNA, herein designated GAM RNA, on one or more GAM5222 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5222 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5222 RNA, herein designated GAM RNA, of GAM5222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM5222 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5222 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5222 RNA correlate with, and may be deduced from, the identity of the GAM5222 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5254 7187 TGAGTGTATG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTGAGAGAG detected oligonucleotides of the present invention, referred to here as Genomic Address
AATGTTATGT Messenger 5254 (GAM5254) oligonucleotides modulates expression of respective target genes
TTATCACTGA whose function and utility is known in the art.

GTTCCCATTG GAM5254 is a novel bioinformatically detectable regulatory, non protein coding,
TTTCATTCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5254 was detected is

ATAGCACTTA described with additional reference to Figs. 9-15.

TTTCTTCATA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTTCTATAC encoded by the human genome.

ACATTTACTC GAM5254 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5254
G precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5254
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5254 precursor RNA is designated SEQ ID:7187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7187 is located from position 107483900 to position 107484000 relative to chromosome X on the `+` strand.

GAM5254 precursor RNA folds onto itself, forming GAM5254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5254 precursor RNA, designated SEQ ID NO: 7187, and a schematic representation of a predicted secondary folding of GAM5254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5254 folded precursor RNA yielding a GAM5254 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5254 RNA, hereby incorporated herein.

GAM5254 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5254 target RNA, herein designated GAM TARGET RNA. GAM5254 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5254 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5254 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5254 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5254 RNA, herein designated GAM RNA, to target binding sites on GAM5254 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5254 target RNA into GAM5254 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5254 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5254 target genes. The mRNA of each one of this plurality of GAM5254 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5254 RNA, herein designated GAM RNA, and which when bound by GAM5254 RNA causes inhibition of translation of the GAM5254 target mRNA into a corresponding GAM5254 target protein.

The mechanism of the translational inhibition exerted by GAM5254 RNA, herein designated GAM RNA, on one or more GAM5254 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5254 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5254 RNA, herein designated GAM RNA, of

GAM5254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5254 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5254 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5254 RNA correlate with, and may be deduced from, the identity of the GAM5254 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5266 6996 TCACTCTGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCCAGGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGTGCAGTG Messenger 5266 (GAM5266) oligonucleotides modulates expression of respective target genes

GTGCAATCTT whose function and utility is known in the art.

GGCTCACTGC GAM5266 is a novel bioinformatically detectable regulatory, non protein coding,

AACCTCCACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5266 was detected is

TCCCGGGTTC described with additional reference to Figs. 9-15.

AAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5266 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5266

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5266

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5266 precursor RNA is designated SEQ ID:6996, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6996 is located from position 28924785 to position 28924860 relative to chromosome 6 on the `+` strand.

GAM5266 precursor RNA folds onto itself, forming GAM5266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5266 precursor RNA, designated SEQ ID NO: 6996, and a schematic representation of a predicted secondary folding of GAM5266 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5266 folded precursor RNA yielding a GAM5266 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5266 RNA, hereby incorporated herein.

GAM5266 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5266 target RNA, herein designated GAM TARGET RNA. GAM5266 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5266 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5266 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5266 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5266 RNA, herein designated GAM RNA, to target binding sites on GAM5266 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5266 target RNA into GAM5266 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5266 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5266 target genes. The mRNA of each one of this plurality of GAM5266 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5266 RNA, herein designated GAM RNA, and which when bound by GAM5266 RNA causes inhibition of translation of the GAM5266 target mRNA into a corresponding GAM5266 target protein.

The mechanism of the translational inhibition exerted by GAM5266 RNA, herein designated GAM RNA, on one or more GAM5266 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5266 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM5266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5266 RNA, herein designated GAM RNA, of GAM5266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5266 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5266 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5266 RNA correlate with, and may be deduced from, the identity of the GAM5266 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGATGTGACC Messenger 5270 (GAM5270) oligonucleotides modulates expression of respective target genes

TGGTGGCCAC whose function and utility is known in the art.

CAAATGCCTT GAM5270 is a novel bioinformatically detectable regulatory, non protein coding,

GGCCTCAGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5270 was detected is

CAAACTAAGC described with additional reference to Figs. 9-15.

AGGGCACACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCTGGG encoded by the human genome.

GAM5270 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5270

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5270

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5270 precursor RNA is designated SEQ ID:6071, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6071 is located from position 99045264 to position 99045350 relative to chromosome 10 on the `+` strand.

GAM5270 precursor RNA folds onto itself, forming GAM5270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5270 precursor RNA, designated SEQ ID NO: 6071, and a schematic representation of a predicted secondary folding of GAM5270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5270 folded precursor RNA yielding a GAM5270 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5270 RNA, hereby incorporated herein.

GAM5270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5270 target RNA, herein designated GAM TARGET RNA. GAM5270 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5270 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5270 RNA, herein designated GAM RNA, to target binding sites on GAM5270 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5270 target RNA into GAM5270 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5270 target genes. The mRNA of each one of this plurality of GAM5270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5270 RNA, herein designated GAM RNA, and which when bound by GAM5270 RNA causes inhibition of translation of the GAM5270 target mRNA into a corresponding GAM5270 target protein.

The mechanism of the translational inhibition exerted by GAM5270 RNA, herein designated GAM RNA, on one or more GAM5270 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5270 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5270 RNA, herein designated GAM RNA, of GAM5270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5270 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5270 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5270 RNA correlate with, and may be deduced from, the identity of the GAM5270 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGTAGAAAAG GAM5278 is a novel bioinformatically detectable regulatory, non protein coding,
AAACAGTGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5278 was detected is

GTACCCCGAT described with additional reference to Figs. 9-15.

AGGGAGGGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGAGAGGAT encoded by the human genome.

GGGA GAM5278 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5278
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5278

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5278 precursor RNA is designated SEQ ID:7035, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7035 is located from position 58433646 to position 58433739 relative to chromosome 16 on the `+` strand.

GAM5278 precursor RNA folds onto itself, forming GAM5278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5278 precursor RNA, designated SEQ ID NO: 7035, and a schematic representation of a predicted secondary folding of GAM5278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5278 folded precursor RNA yielding a GAM5278 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5278 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5278 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5278 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5278 target RNA, herein designated GAM TARGET RNA. GAM5278 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5278 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5278 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5278 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5278 RNA, herein designated GAM RNA, to target binding sites on GAM5278 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5278 target RNA into GAM5278 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM5278 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5278 target genes. The mRNA of each one of this plurality of GAM5278 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5278 RNA, herein designated GAM RNA, and which when bound by GAM5278 RNA causes inhibition of translation of the GAM5278 target mRNA into a corresponding GAM5278 target protein.

The mechanism of the translational inhibition exerted by GAM5278 RNA, herein designated GAM RNA, on one or more GAM5278 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5278 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5278 RNA, herein designated GAM RNA, of GAM5278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5278 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5278 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5278 RNA correlate with, and may be deduced from, the identity of the GAM5278 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5292 7198 TGCCCTGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCAGAATTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTAGATTGC Messenger 5292 (GAM5292) oligonucleotides modulates expression of respective target genes

TATTACAATG whose function and utility is known in the art.

CTGATTATAT GAM5292 is a novel bioinformatically detectable regulatory, non protein coding,

TTTATAGCAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5292 was detected is

TTACTGACAT described with additional reference to Figs. 9-15.

AAGGTTATAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTGGGCA encoded by the human genome.

GAM5292 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5292 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5292 precursor RNA is designated SEQ ID:7198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7198 is located from position 96304363 to position 96304450 relative to chromosome 11 on the `-` strand.

GAM5292 precursor RNA folds onto itself, forming GAM5292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5292 precursor RNA, designated SEQ ID NO: 7198, and a schematic representation of a predicted secondary folding of GAM5292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5292 folded precursor RNA yielding a GAM5292 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5292 RNA, hereby incorporated herein.

GAM5292 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5292 target RNA, herein designated GAM TARGET RNA. GAM5292 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5292 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5292 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5292 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5292 RNA, herein designated GAM RNA, to target binding sites on GAM5292 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5292 target RNA into GAM5292 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5292 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5292 target genes. The mRNA of each one of this plurality of GAM5292 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5292 RNA, herein designated GAM RNA, and which when bound by GAM5292 RNA causes inhibition of translation of the GAM5292 target mRNA into a corresponding GAM5292 target protein.

The mechanism of the translational inhibition exerted by GAM5292 RNA, herein designated GAM RNA, on one or more GAM5292 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5292 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5292 RNA, herein designated GAM RNA, of GAM5292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5292 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5292 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5292 RNA correlate with, and may be deduced from, the identity of the GAM5292 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5324 7006 TCACTTTGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GATATCATGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAGGTGTAC Messenger 5324 (GAM5324) oligonucleotides modulates expression of respective target genes

TTCCGGTGAT whose function and utility is known in the art.

GCCTAGAGGT GAM5324 is a novel bioinformatically detectable regulatory, non protein coding,

CACGTCCTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5324 was detected is

GATGTCATTA described with additional reference to Figs. 9-15.

GGCTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM5324 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5324 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5324 precursor RNA is designated SEQ ID:7006, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7006 is located from position 51118141 to position 51118216 relative to chromosome 19 on the `-` strand.

GAM5324 precursor RNA folds onto itself, forming GAM5324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5324 precursor RNA, designated SEQ ID NO: 7006, and a schematic representation of a predicted secondary folding of GAM5324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5324 folded precursor RNA yielding a GAM5324 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5324 RNA, hereby incorporated herein.

GAM5324 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5324 target RNA, herein designated GAM TARGET RNA. GAM5324 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5324 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5324 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5324 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5324 RNA, herein designated GAM RNA, to target binding sites on GAM5324 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5324 target RNA into GAM5324 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5324 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5324 target genes. The mRNA of each one of this plurality of GAM5324 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5324 RNA, herein designated GAM RNA, and which when bound by GAM5324 RNA causes inhibition of translation of the GAM5324 target mRNA into a corresponding GAM5324 target protein.

The mechanism of the translational inhibition exerted by GAM5324 RNA, herein designated GAM RNA, on one or more GAM5324 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5324 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5324 RNA, herein designated GAM RNA, of GAM5324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5324 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5324 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5324 RNA correlate with, and may be deduced from, the identity of the GAM5324 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5329 7194 TGATTCAAAG CAAGATGGTA GCATTGGAGA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 5329 (GAM5329) oligonucleotides modulates expression of respective target genes

GGATGAGATA whose function and utility is known in the art.

TGGTCAGATG GAM5329 is a novel bioinformatically detectable regulatory, non protein coding, AGGATATATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5329 was detected is

TTAAAAGTTG described with additional reference to Figs. 9-15.

AGCTAACAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATTTGCTGAG encoded by the human genome.

GAATCA GAM5329 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5329 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5329 precursor RNA is designated SEQ ID:7194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7194 is located from position 133099409 to position 133099504 relative to chromosome 7 on the `+` strand.

GAM5329 precursor RNA folds onto itself, forming GAM5329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5329 precursor RNA, designated SEQ ID NO: 7194, and a schematic representation of a predicted secondary folding of GAM5329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5329 folded precursor RNA yielding a GAM5329 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5329 RNA, hereby incorporated herein.

GAM5329 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5329 target RNA, herein designated GAM TARGET RNA. GAM5329 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5329 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5329 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5329 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5329 RNA, herein designated GAM RNA, to target binding sites on GAM5329 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5329 target RNA into GAM5329 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5329 target genes. precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5354 precursor RNA is designated SEQ ID:7278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7278 is located from position 68147756 to position 68147845 relative to chromosome 11 on the `-` strand.

GAM5354 precursor RNA folds onto itself, forming GAM5354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5354 precursor RNA, designated SEQ ID NO: 7278, and a schematic representation of a predicted secondary folding of GAM5354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5354 folded precursor RNA yielding a GAM5354 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5354 RNA, hereby incorporated herein.

GAM5354 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5354 target RNA, herein designated GAM TARGET RNA. GAM5354 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5354 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5354 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5354 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5354 RNA, herein designated GAM RNA, to target binding sites on GAM5354 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5354 target RNA into GAM5354 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5354 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5354 target genes. The mRNA of each one of this plurality of GAM5354 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5354 RNA, herein designated GAM RNA, and which when bound by GAM5354 RNA causes inhibition of translation of the GAM5354 target mRNA into a corresponding GAM5354 target protein.

The mechanism of the translational inhibition exerted by GAM5354 RNA, herein designated GAM RNA, on one or more GAM5354 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5354 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5354 RNA, herein designated GAM RNA, of

GAM5354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5354 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5354 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5354 RNA correlate with, and may be deduced from, the identity of the GAM5354 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5370 5957 ATCCTGGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGACCCTACC detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGTCATTTT Messenger 5370 (GAM5370) oligonucleotides modulates expression of respective target genes

ATCTACCCCA whose function and utility is known in the art.

ACCATGGTTA GAM5370 is a novel bioinformatically detectable regulatory, non protein coding,

AAGTGGCTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5370 was detected is

AGTGGAGTCT described with additional reference to Figs. 9-15.

TGGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5370 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5370

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5370

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5370 precursor RNA is designated SEQ ID:5957, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5957 is located from position 26652582 to position 26652656 relative to chromosome 11 on the `-` strand.

GAM5370 precursor RNA folds onto itself, forming GAM5370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5370 precursor RNA, designated SEQ ID NO: 5957, and a schematic representation of a predicted secondary folding of GAM5370 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5370 folded precursor RNA yielding a GAM5370 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5370 RNA, hereby incorporated herein.

GAM5370 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5370 target RNA, herein designated GAM TARGET RNA. GAM5370 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5370 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5370 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5370 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5370 RNA, herein designated GAM RNA, to target binding sites on GAM5370 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5370 target RNA into GAM5370 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5370 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5370 target genes. The mRNA of each one of this plurality of GAM5370 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5370 RNA, herein designated GAM RNA, and which when bound by GAM5370 RNA causes inhibition of translation of the GAM5370 target mRNA into a corresponding GAM5370 target protein.

The mechanism of the translational inhibition exerted by GAM5370 RNA, herein designated GAM RNA, on one or more GAM5370 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5370 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM5370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5370 RNA, herein designated GAM RNA, of GAM5370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5370 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5370 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5370 RNA correlate with, and may be deduced from, the identity of the GAM5370 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5371 5812 AGTCTTGCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTCACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGGAGTGC Messenger 5371 (GAM5371) oligonucleotides modulates expression of respective target genes

AGTGGTGCCA whose function and utility is known in the art.

TCTTGGCTCA GAM5371 is a novel bioinformatically detectable regulatory, non protein coding,

CTGCAACCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5371 was detected is

CGCCTCCCCA described with additional reference to Figs. 9-15.

GTTCAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TT encoded by the human genome.

GAM5371 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5371

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5371

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5371 precursor RNA is designated SEQ ID:5812, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5812 is located from position 17214638 to position 17214719 relative to chromosome 19 on the `-` strand.

GAM5371 precursor RNA folds onto itself, forming GAM5371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5371 precursor RNA, designated SEQ ID NO: 5812, and a schematic representation of a predicted secondary folding of GAM5371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5371 folded precursor RNA yielding a GAM5371 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5371 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5371 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5371 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5371 target RNA, herein designated GAM TARGET RNA. GAM5371 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5371 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5371 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5371 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5371 RNA, herein designated GAM RNA, to target binding sites on GAM5371 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5371 target RNA into GAM5371 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5371 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5371 target genes. The mRNA of each one of this plurality of GAM5371 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5371 RNA, herein designated GAM RNA, and which when bound by GAM5371 RNA causes inhibition of translation of the GAM5371 target mRNA into a corresponding GAM5371 target protein.

The mechanism of the translational inhibition exerted by GAM5371 RNA, herein

designated GAM RNA, on one or more GAM5371 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5371 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5371 RNA, herein designated GAM RNA, of GAM5371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5371 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5371 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5371 RNA correlate with, and may be deduced from, the identity of the GAM5371 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACACATTTTG GAM5374 is a novel bioinformatically detectable regulatory, non protein coding,
TATTTTAATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5374 was detected is

ATTTCAAGGA described with additional reference to Figs. 9-15.

GTGAAGAAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGGGTGTTT encoded by the human genome.

TTGTTTTTGT GAM5374 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5374
AGTTCTGATT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5374
ACTCATTTAT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
GCATTGTTTT to the nucleotide sequence of GAM5374 precursor RNA is designated SEQ ID:6042, and is

G provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:6042 is located from position 37551253 to position 37551383 relative to chromosome 19 on the `+` strand.

GAM5374 precursor RNA folds onto itself, forming GAM5374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5374 precursor RNA, designated SEQ ID NO: 6042, and a schematic representation of a predicted secondary folding of GAM5374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5374 folded precursor RNA yielding a GAM5374 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5374 RNA, hereby incorporated herein.

GAM5374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5374 target RNA, herein designated GAM TARGET RNA. GAM5374 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5374 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5374 RNA, herein designated GAM RNA, to target binding sites on GAM5374 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5374 target RNA into GAM5374 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5374 target genes. The mRNA of each one of this

plurality of GAM5374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5374 RNA, herein designated GAM RNA, and which when bound by GAM5374 RNA causes inhibition of translation of the GAM5374 target mRNA into a corresponding GAM5374 target protein.

The mechanism of the translational inhibition exerted by GAM5374 RNA, herein designated GAM RNA, on one or more GAM5374 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5374 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5374 RNA, herein designated GAM RNA, of GAM5374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5374 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5374 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5374 RNA correlate with, and may be deduced from, the identity of the GAM5374 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5385 6032 CAGTGGGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGGGCCGAT detected oligonucleotides of the present invention, referred to here as Genomic Address

ACACTGTACG Messenger 5385 (GAM5385) oligonucleotides modulates expression of respective target genes

AGAGTGAGTA whose function and utility is known in the art.

GCAGGTCTCA GAM5385 is a novel bioinformatically detectable regulatory, non protein coding,

CAGTGAACCG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5385 was detected is

GTCTCTTTCC described with additional reference to Figs. 9-15.

CTACTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5385 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5385

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5385 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5385 precursor RNA is designated SEQ ID:6032, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6032 is located from position 35621432 to position 35621507 relative to chromosome 3 on the `+` strand.

GAM5385 precursor RNA folds onto itself, forming GAM5385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5385 precursor RNA, designated SEQ ID NO: 6032, and a schematic representation of a predicted secondary folding of GAM5385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5385 folded precursor RNA yielding a GAM5385 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5385 RNA, hereby incorporated herein. Expression of GAM5385 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM5385 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5385 target RNA, herein designated GAM TARGET RNA. GAM5385 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5385 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5385 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5385 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5385 RNA, herein designated GAM RNA, to target

binding sites on GAM5385 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5385 target RNA into GAM5385 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5385 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5385 target genes. The mRNA of each one of this plurality of GAM5385 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5385 RNA, herein designated GAM RNA, and which when bound by GAM5385 RNA causes inhibition of translation of the GAM5385 target mRNA into a corresponding GAM5385 target protein.

The mechanism of the translational inhibition exerted by GAM5385 RNA, herein designated GAM RNA, on one or more GAM5385 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5385 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5385 RNA, herein designated GAM RNA, of GAM5385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5385 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5385 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5385 RNA correlate with, and may be deduced from, the identity of the GAM5385 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCTGGAGTT detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGTGGTATG Messenger 5415 (GAM5415) oligonucleotides modulates expression of respective target genes

ATCACAACTC whose function and utility is known in the art.

TCCTAAGCCT GAM5415 is a novel bioinformatically detectable regulatory, non protein coding,

CAAACACCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5415 was detected is

GGATCAAGTG described with additional reference to Figs. 9-15.

ATCCTCTGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTCAGCCTCC encoded by the human genome.

CAAGTAG GAM5415 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5415 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5415 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5415 precursor RNA is designated SEQ ID:6188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6188 is located from position 41537048 to position 41537144 relative to chromosome 18 on the `+` strand.

GAM5415 precursor RNA folds onto itself, forming GAM5415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5415 precursor RNA, designated SEQ ID NO: 6188, and a schematic representation of a predicted secondary folding of GAM5415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5415 folded precursor RNA yielding a GAM5415 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5415 RNA, hereby incorporated herein.

GAM5415 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5415 target RNA, herein designated GAM TARGET RNA. GAM5415 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5415 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5415 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5415 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5415 RNA, herein designated GAM RNA, to target binding sites on GAM5415 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5415 target RNA into GAM5415 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5415 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5415 target genes. The mRNA of each one of this plurality of GAM5415 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5415 RNA, herein designated GAM RNA, and which when bound by GAM5415 RNA causes inhibition of translation of the GAM5415 target mRNA into a corresponding GAM5415 target protein.

The mechanism of the translational inhibition exerted by GAM5415 RNA, herein designated GAM RNA, on one or more GAM5415 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5415 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5415 RNA, herein designated GAM RNA, of GAM5415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5415 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5415 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5415 RNA correlate with, and may be deduced from, the identity of the GAM5415 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5422 6915 GTGGGAGGAG GACTGGCAAA AATATGAGAG TAGGAGTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 5422 (GAM5422) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GGCTCTTGAG GAM5422 is a novel bioinformatically detectable regulatory, non protein coding, CTTGGGCCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5422 was detected is

GCCTTCAAAT described with additional reference to Figs. 9-15.

TTCCACTCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCACTCAC encoded by the human genome.

GAM5422 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5422 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5422 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5422 precursor RNA is designated SEQ ID:6915, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6915 is located from position 47243046 to position 47243133 relative to chromosome X on the `+` strand.

GAM5422 precursor RNA folds onto itself, forming GAM5422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5422 precursor RNA, designated SEQ ID NO: 6915, and a schematic representation of a predicted secondary folding of GAM5422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5422 folded precursor RNA yielding a GAM5422 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5422 RNA, hereby incorporated herein.

GAM5422 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5422 target RNA, herein designated GAM TARGET RNA. GAM5422 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5422 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5422 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM5422 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5422 RNA, herein designated GAM RNA, to target binding sites on GAM5422 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5422 target RNA into GAM5422 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5422 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5422 target genes. The mRNA of each one of this plurality of GAM5422 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5422 RNA, herein designated GAM RNA, and which when bound by GAM5422 RNA causes inhibition of translation of the GAM5422 target mRNA into a corresponding GAM5422 target protein.

The mechanism of the translational inhibition exerted by GAM5422 RNA, herein designated GAM RNA, on one or more GAM5422 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5422 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5422 RNA, herein designated GAM RNA, of GAM5422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5422 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5422 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5422 RNA correlate with, and may be deduced from, the identity of the GAM5422 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5444 6297 GAAGGGTACC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCTGGAGAC detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGTGTGGTT Messenger 5444 (GAM5444) oligonucleotides modulates expression of respective target
genes
TGTGGGGTGG whose function and utility is known in the art.

GTTTCTTATA GAM5444 is a novel bioinformatically detectable regulatory, non protein coding,
TCACTGAATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5444 was detected is

TAAAGTGGGT described with additional reference to Figs. 9-15.

GCCTTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
encoded by the human genome.

GAM5444 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5444

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM5444
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5444 precursor RNA is designated SEQ ID:6297, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6297 is located from position 127094099 to position 127094175 relative to chromosome 9 on the `+` strand.

GAM5444 precursor RNA folds onto itself, forming GAM5444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5444 precursor RNA, designated SEQ ID NO: 6297, and a schematic representation of a predicted secondary folding of GAM5444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5444 folded precursor RNA yielding a GAM5444 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5444 RNA, hereby incorporated herein.

GAM5444 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5444 target RNA, herein designated GAM TARGET RNA. GAM5444 target
RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5444 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5444 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5444 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5444 RNA, herein designated GAM RNA, to target binding sites on GAM5444 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5444 target RNA into GAM5444 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5444 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5444 target genes. The mRNA of each one of this plurality of GAM5444 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5444 RNA, herein designated GAM RNA, and which when bound by GAM5444 RNA causes inhibition of translation of the GAM5444 target mRNA into a corresponding GAM5444 target protein.

The mechanism of the translational inhibition exerted by GAM5444 RNA, herein designated GAM RNA, on one or more GAM5444 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5444 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5444 RNA, herein designated GAM RNA, of GAM5444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5444 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5444 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5444 RNA correlate with, and may be deduced from, the identity of the GAM5444 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

TCTTGCATAC detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGCACAGTG Messenger 5454 (GAM5454) oligonucleotides modulates expression of respective target genes
GATGGGGAAT whose function and utility is known in the art.

GGTGTGACCT GAM5454 is a novel bioinformatically detectable regulatory, non protein coding,
CTGTCCCTGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5454 was detected is

TCTCTTCTCT described with additional reference to Figs. 9-15.

GCTGGCTTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGTCTATTC encoded by the human genome.

TCC GAM5454 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5454
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5454
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5454 precursor RNA is designated SEQ ID:6600, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6600 is located from position 101393105 to position 101393197 relative to chromosome X on the `+` strand.

GAM5454 precursor RNA folds onto itself, forming GAM5454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5454 precursor RNA, designated SEQ ID NO: 6600, and a schematic representation of a predicted secondary folding of GAM5454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5454 folded precursor RNA yielding a GAM5454 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5454 RNA, hereby incorporated herein.

GAM5454 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM5454 target RNA, herein designated GAM TARGET RNA. GAM5454 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5454 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5454 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5454 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5454 RNA, herein designated GAM RNA, to target binding sites on GAM5454 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5454 target RNA into GAM5454 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5454 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5454 target genes. The mRNA of each one of this plurality of GAM5454 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5454 RNA, herein designated GAM RNA, and which when bound by GAM5454 RNA causes inhibition of translation of the GAM5454 target mRNA into a corresponding GAM5454 target protein.

The mechanism of the translational inhibition exerted by GAM5454 RNA, herein designated GAM RNA, on one or more GAM5454 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5454 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5454 RNA, herein designated GAM RNA, of GAM5454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5454 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM5454 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5454 RNA correlate with, and may be deduced from, the identity of the GAM5454 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCTGAAGCT detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTCCCATAA Messenger 5498 (GAM5498) oligonucleotides modulates expression of respective target genes
GACCCTGAAT whose function and utility is known in the art.

CTAGCAGCCA GAM5498 is a novel bioinformatically detectable regulatory, non protein coding,
CTGTGTACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5498 was detected is

described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5498 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5498

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5498

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5498 precursor RNA is designated SEQ ID:5821, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5821 is located from position 3674783 to position 3674841 relative to chromosome 16 on the `+` strand.

GAM5498 precursor RNA folds onto itself, forming GAM5498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5498 precursor RNA, designated SEQ ID NO: 5821, and a schematic representation of a predicted secondary folding of GAM5498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5498 folded precursor RNA yielding a GAM5498 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5498 RNA, hereby incorporated herein.

GAM5498 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5498 target RNA, herein designated GAM TARGET RNA. GAM5498 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5498 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5498 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5498 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5498 RNA, herein designated GAM RNA, to target binding sites on GAM5498 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5498 target RNA into GAM5498 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5498 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5498 target genes. The mRNA of each one of this plurality of GAM5498 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5498 RNA, herein designated GAM RNA, and which when bound by GAM5498 RNA causes inhibition of translation of the GAM5498 target mRNA into a corresponding GAM5498 target protein.

The mechanism of the translational inhibition exerted by GAM5498 RNA, herein designated GAM RNA, on one or more GAM5498 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5498 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5498 RNA, herein designated GAM RNA, of GAM5498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5498 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5498 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5498 RNA correlate with, and may be deduced from, the identity of the GAM5498 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5512 5758 AGGAGGGAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCCCAGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGGAGAAAG Messenger 5512 (GAM5512) oligonucleotides modulates expression of respective target genes

GCAGACTCAG whose function and utility is known in the art.

CCAGGGATGG GAM5512 is a novel bioinformatically detectable regulatory, non protein coding,

GTGAGGGTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5512 was detected is

CCCTGTCCCA described with additional reference to Figs. 9-15.

AAGCAAGACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGCT encoded by the human genome.

GAM5512 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5512

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5512

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5512 precursor RNA is designated SEQ ID:5758, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5758 is located from position 54100819 to position 54100904 relative to chromosome 19 on the `+` strand.

GAM5512 precursor RNA folds onto itself, forming GAM5512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5512 precursor RNA, designated SEQ ID NO: 5758, and a schematic representation of a predicted secondary folding of GAM5512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5512 folded precursor RNA yielding a GAM5512 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5512 RNA, hereby incorporated herein.

GAM5512 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5512 target RNA, herein designated GAM TARGET RNA. GAM5512 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5512 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5512 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5512 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5512 RNA, herein designated GAM RNA, to target binding sites on GAM5512 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5512 target RNA into GAM5512 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5512 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5512 target genes. The mRNA of each one of this plurality of GAM5512 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5512 RNA, herein designated GAM RNA, and which when bound by GAM5512 RNA causes inhibition of translation of the GAM5512 target mRNA into a corresponding GAM5512 target protein.

The mechanism of the translational inhibition exerted by GAM5512 RNA, herein designated GAM RNA, on one or more GAM5512 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5512 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5512 RNA, herein designated GAM RNA, of GAM5512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5512 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5512 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5512 RNA correlate with, and may be deduced from, the identity of the GAM5512 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5514 6856 GGTTGCCGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGAGGAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCTACCAGC Messenger 5514 (GAM5514) oligonucleotides modulates expression of respective target genes

GTCTGCTGGG whose function and utility is known in the art.

CAGAGACCAG GAM5514 is a novel bioinformatically detectable regulatory, non protein coding,

GGATGCTGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5514 was detected is

CCACATCCCA described with additional reference to Figs. 9-15.

CAATGCACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACAATC encoded by the human genome.

GAM5514 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5514

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5514

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5514 precursor RNA is designated SEQ ID:6856, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6856 is located from position 25442199 to position 25442285 relative to chromosome 22 on the `+` strand.

GAM5514 precursor RNA folds onto itself, forming GAM5514 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5514 precursor RNA, designated SEQ ID NO: 6856, and a schematic representation of a predicted secondary folding of GAM5514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5514 folded precursor RNA yielding a GAM5514 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5514 RNA, hereby incorporated herein.

GAM5514 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5514 target RNA, herein designated GAM TARGET RNA. GAM5514 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5514 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5514 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5514 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5514 RNA, herein designated GAM RNA, to target binding sites on GAM5514 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5514 target RNA into GAM5514 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5514 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5514 target genes. The mRNA of each one of this plurality of GAM5514 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5514 RNA, herein designated GAM RNA, and which when bound by GAM5514 RNA causes inhibition of translation of the GAM5514 target mRNA into a corresponding GAM5514 target protein.

The mechanism of the translational inhibition exerted by GAM5514 RNA, herein designated GAM RNA, on one or more GAM5514 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5514 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5514 RNA, herein designated GAM RNA, of GAM5514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5514 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5514 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5514 RNA correlate with, and may be deduced from, the identity of the GAM5514 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5526 6448 GAGGGCTTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAATGCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCAGAGCTG Messenger 5526 (GAM5526) oligonucleotides modulates expression of respective target genes

CACCCCAGAC whose function and utility is known in the art.

CAACAAAATC GAM5526 is a novel bioinformatically detectable regulatory, non protein coding,

AGACTCTCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5526 was detected is

GGATGCGGCC described with additional reference to Figs. 9-15.

AAGGCATCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TATGTGGAAA encoded by the human genome.

GCTTTC GAM5526 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5526

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5526

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5526 precursor RNA is designated SEQ ID:6448, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6448 is located from position 79906276 to position 79906371 relative to chromosome 14 on the `-` strand.

GAM5526 precursor RNA folds onto itself, forming GAM5526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5526 precursor RNA, designated SEQ ID NO: 6448, and a schematic representation of a predicted secondary folding of GAM5526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5526 folded precursor RNA yielding a GAM5526 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5526 RNA, hereby incorporated herein.

GAM5526 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5526 target RNA, herein designated GAM TARGET RNA. GAM5526 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5526 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5526 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5526 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5526 RNA, herein designated GAM RNA, to target binding sites on GAM5526 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5526 target RNA into GAM5526 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5526 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM5526 target genes. The mRNA of each one of this plurality of GAM5526 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5526 RNA, herein designated GAM RNA, and which when bound by GAM5526 RNA causes inhibition of translation of the GAM5526 target mRNA into a corresponding GAM5526 target protein.

The mechanism of the translational inhibition exerted by GAM5526 RNA, herein designated GAM RNA, on one or more GAM5526 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5526 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5526 RNA, herein designated GAM RNA, of GAM5526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5526 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5526 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5526 RNA correlate with, and may be deduced from, the identity of the GAM5526 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTAGACTGAA whose function and utility is known in the art.

TATGGACTGA GAM5615 is a novel bioinformatically detectable regulatory, non protein coding,
ATGGGTCAGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5615 was detected is

TTTGGGGAAA described with additional reference to Figs. 9-15.

TGTGTTTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGACAGCTG encoded by the human genome.

AGGGACCAGA GAM5615 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5615

GAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5615

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5615 precursor RNA is designated SEQ ID:6172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6172 is located from position 51339544 to position 51339646 relative to chromosome 12 on the `-` strand.

GAM5615 precursor RNA folds onto itself, forming GAM5615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5615 precursor RNA, designated SEQ ID NO: 6172, and a schematic representation of a predicted secondary folding of GAM5615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5615 folded precursor RNA yielding a GAM5615 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5615 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5615 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5615 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5615 target RNA, herein designated GAM TARGET RNA. GAM5615 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5615 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5615 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5615 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5615 RNA, herein designated GAM RNA, to target binding sites on GAM5615 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5615 target RNA into GAM5615 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5615 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5615 target genes. The mRNA of each one of this plurality of GAM5615 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5615 RNA, herein designated GAM RNA, and which when bound by GAM5615 RNA causes inhibition of translation of the GAM5615 target mRNA into a corresponding GAM5615 target protein.

The mechanism of the translational inhibition exerted by GAM5615 RNA, herein designated GAM RNA, on one or more GAM5615 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5615 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5615 RNA, herein designated GAM RNA, of GAM5615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5615 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5615 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5615 RNA correlate with, and may be deduced from, the identity of the GAM5615 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 5617 (GAM5617) oligonucleotides modulates expression of respective target genes

TTCCTGGGTT whose function and utility is known in the art.

CATATCCTGG GAM5617 is a novel bioinformatically detectable regulatory, non protein coding,
TTCTACCAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5617 was detected is

TTACCAGCTG described with additional reference to Figs. 9-15.

TGTGAACTTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGAAAATTCC encoded by the human genome.

TCTCCGCCTC GAM5617 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5617
TTAGTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5617

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5617 precursor RNA is designated SEQ ID:6758, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6758 is located from position 47865219 to position 47865324 relative to chromosome X on the `-` strand.

GAM5617 precursor RNA folds onto itself, forming GAM5617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5617 precursor RNA, designated SEQ ID NO: 6758, and a schematic representation of a predicted secondary folding of GAM5617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5617 folded precursor RNA yielding a GAM5617 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5617 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5617 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5617 target RNA, herein designated GAM TARGET RNA. GAM5617 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5617 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM5617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5617 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5617 RNA, herein designated GAM RNA, to target binding sites on GAM5617 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5617 target RNA into GAM5617 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5617 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5617 target genes. The mRNA of each one of this plurality of GAM5617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5617 RNA, herein designated GAM RNA, and which when bound by GAM5617 RNA causes inhibition of translation of the GAM5617 target mRNA into a corresponding GAM5617 target protein.

The mechanism of the translational inhibition exerted by GAM5617 RNA, herein designated GAM RNA, on one or more GAM5617 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5617 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5617 RNA, herein designated GAM RNA, of GAM5617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5617 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5617 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5617 RNA correlate with, and may be deduced from, the identity of the GAM5617 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5623 5747 AGCATATGAC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGCAAGACAC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGCCCTGGA Messenger 5623 (GAM5623) oligonucleotides modulates expression of respective target genes
ATCCTCCGTG whose function and utility is known in the art.

TCACATGTGG GAM5623 is a novel bioinformatically detectable regulatory, non protein coding,
GCTGCTGACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5623 was detected is

GGAAGAATGT described with additional reference to Figs. 9-15.

GCTTTTGTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGTTGTT encoded by the human genome.

GAM5623 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5623

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5623

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5623 precursor RNA is designated SEQ ID:5747, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5747 is located from position 113971966 to position 113972053 relative to chromosome 11 on the `+` strand.

GAM5623 precursor RNA folds onto itself, forming GAM5623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5623 precursor RNA, designated SEQ ID NO: 5747, and a schematic representation of a predicted secondary folding of GAM5623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5623 folded precursor RNA yielding a GAM5623 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5623 RNA, hereby incorporated herein.

GAM5623 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5623 target RNA, herein designated GAM TARGET RNA. GAM5623 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5623 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5623 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5623 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5623 RNA, herein designated GAM RNA, to target binding sites on GAM5623 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5623 target RNA into GAM5623 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5623 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5623 target genes. The mRNA of each one of this plurality of GAM5623 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5623 RNA, herein designated GAM RNA, and which when bound by GAM5623 RNA causes inhibition of translation of the GAM5623 target mRNA into a corresponding GAM5623 target protein.

The mechanism of the translational inhibition exerted by GAM5623 RNA, herein designated GAM RNA, on one or more GAM5623 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5623 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5623 RNA, herein designated GAM RNA, of GAM5623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5623 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5623 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5623 RNA correlate with, and may be deduced from, the identity of the GAM5623 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGAATCTCCA GAM5654 is a novel bioinformatically detectable regulatory, non protein coding,

GGGGATCCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5654 was detected is

GAATTGGTGT described with additional reference to Figs. 9-15.

TT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5654 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5654

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5654

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5654 precursor RNA is designated SEQ ID:5652, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5652 is located from position 21698933 to position 21699004 relative to chromosome 16 on the `+` strand.

GAM5654 precursor RNA folds onto itself, forming GAM5654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5654 precursor RNA, designated SEQ ID NO: 5652, and a schematic representation of a predicted secondary folding of GAM5654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5654 folded precursor RNA yielding a GAM5654 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5654 RNA, hereby incorporated herein.

GAM5654 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5654 target RNA, herein designated GAM TARGET RNA. GAM5654 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5654 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5654 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5654 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5654 RNA, herein designated GAM RNA, to target binding sites on GAM5654 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5654 target RNA into GAM5654 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5654 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5654 target genes. The mRNA of each one of this plurality of GAM5654 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5654 RNA, herein designated GAM RNA, and which when bound by GAM5654 RNA causes inhibition of translation of the GAM5654 target mRNA into a corresponding GAM5654 target protein.

The mechanism of the translational inhibition exerted by GAM5654 RNA, herein designated GAM RNA, on one or more GAM5654 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5654 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5654 RNA, herein designated GAM RNA, of GAM5654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5654 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5654 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5654 RNA correlate with, and may be deduced from, the identity of the GAM5654 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5657 6791 GGGAGGATCG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTGAGCCTA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGGTCAAG Messenger 5657 (GAM5657) oligonucleotides modulates expression of respective target genes

GCTGCAGTGA whose function and utility is known in the art.

GCTGAGATCA GAM5657 is a novel bioinformatically detectable regulatory, non protein coding,

CACCACTGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5657 was detected is

CTCCTGCCTA described with additional reference to Figs. 9-15.

GGTGACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACTGTC encoded by the human genome.

GAM5657 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5657

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5657

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5657 precursor RNA is designated SEQ ID:6791, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6791 is located from position 1344537 to position 1344626 relative to chromosome 12 on the `+` strand.

GAM5657 precursor RNA folds onto itself, forming GAM5657 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5657 precursor RNA, designated SEQ ID NO: 6791, and a schematic representation of a predicted secondary folding of GAM5657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5657 folded precursor RNA yielding a GAM5657 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5657 RNA, hereby incorporated herein.

GAM5657 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5657 target RNA, herein designated GAM TARGET RNA. GAM5657 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5657 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5657 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5657 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5657 RNA, herein designated GAM RNA, to target binding sites on GAM5657 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5657 target RNA into GAM5657 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5657 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5657 target genes. The mRNA of each one of this plurality of GAM5657 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5657 RNA, herein designated GAM RNA, and which when bound by GAM5657 RNA causes inhibition of translation of the GAM5657 target mRNA into a corresponding GAM5657 target protein.

The mechanism of the translational inhibition exerted by GAM5657 RNA, herein designated GAM RNA, on one or more GAM5657 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5657 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5657 RNA, herein designated GAM RNA, of GAM5657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5657 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5657 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5657 RNA correlate with, and may be deduced from, the identity of the GAM5657 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5673 5816 AGTGGTAATG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCGTGTGTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATAGAAATAT Messenger 5673 (GAM5673) oligonucleotides modulates expression of respective target genes
GTAATCGATC whose function and utility is known in the art.

TTTTCTTTGG GAM5673 is a novel bioinformatically detectable regulatory, non protein coding,
TGGGCAATTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5673 was detected is

GCAATATTGA described with additional reference to Figs. 9-15.

GGAAAGTTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGATGTATGT encoded by the human genome.

ATCCCTACCA GAM5673 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5673
CTTGAAACAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5673
CTGGAAATGC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CATT to the nucleotide sequence of GAM5673 precursor RNA is designated SEQ ID:5816, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5816 is located from position 7772009 to position 7772132 relative to chromosome X on the `-` strand.

GAM5673 precursor RNA folds onto itself, forming GAM5673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5673 precursor RNA, designated SEQ ID NO: 5816, and a schematic representation of a predicted secondary folding of GAM5673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5673 folded precursor RNA yielding a GAM5673 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5673 RNA, hereby incorporated herein.

GAM5673 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5673 target RNA, herein designated GAM TARGET RNA. GAM5673 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5673 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5673 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5673 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5673 RNA, herein designated GAM RNA, to target binding sites on GAM5673 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5673 target RNA into GAM5673 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5673 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM5673 target genes. The mRNA of each one of this plurality of GAM5673 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5673 RNA, herein designated GAM RNA, and which when bound by GAM5673 RNA causes inhibition of translation of the GAM5673 target mRNA into a corresponding GAM5673 target protein.

The mechanism of the translational inhibition exerted by GAM5673 RNA, herein designated GAM RNA, on one or more GAM5673 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5673 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5673 RNA, herein designated GAM RNA, of GAM5673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5673 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5673 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5673 RNA correlate with, and may be deduced from, the identity of the GAM5673 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5691 6774 GGGAAAGGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGAGGGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAAAGGCAG Messenger 5691 (GAM5691) oligonucleotides modulates expression of respective target genes

ACTCAGCCAG whose function and utility is known in the art.

GGATGGGTGA GAM5691 is a novel bioinformatically detectable regulatory, non protein coding,

GGGTTTCCCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5691 was detected is

GTCCCAAAGC described with additional reference to Figs. 9-15.

AAGACCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5691 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5691 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5691 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5691 precursor RNA is designated SEQ ID:6774, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6774 is located from position 54100823 to position 54100899 relative to chromosome 19 on the `+` strand.

GAM5691 precursor RNA folds onto itself, forming GAM5691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5691 precursor RNA, designated SEQ ID NO: 6774, and a schematic representation of a predicted secondary folding of GAM5691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5691 folded precursor RNA yielding a GAM5691 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5691 RNA, hereby incorporated herein.

GAM5691 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5691 target RNA, herein designated GAM TARGET RNA. GAM5691 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5691 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5691 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5691 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5691 RNA, herein designated GAM RNA, to target

binding sites on GAM5691 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5691 target RNA into GAM5691 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5691 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5691 target genes. The mRNA of each one of this plurality of GAM5691 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5691 RNA, herein designated GAM RNA, and which when bound by GAM5691 RNA causes inhibition of translation of the GAM5691 target mRNA into a corresponding GAM5691 target protein.

The mechanism of the translational inhibition exerted by GAM5691 RNA, herein designated GAM RNA, on one or more GAM5691 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5691 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5691 RNA, herein designated GAM RNA, of GAM5691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5691 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5691 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5691 RNA correlate with, and may be deduced from, the identity of the GAM5691 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATCTGTCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCCTGTGCAT Messenger 5697 (GAM5697) oligonucleotides modulates expression of respective target genes
TGCTCCGAGG whose function and utility is known in the art.

CAGTTCTGAG GAM5697 is a novel bioinformatically detectable regulatory, non protein coding,
TGGATGATGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5697 was detected is

ACAGATGGGA described with additional reference to Figs. 9-15.

TTCCTCAGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAT encoded by the human genome.

GAM5697 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5697 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5697 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5697 precursor RNA is designated SEQ ID:5966, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5966 is located from position 31719324 to position 31719406 relative to chromosome 16 on the `+` strand.

GAM5697 precursor RNA folds onto itself, forming GAM5697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5697 precursor RNA, designated SEQ ID NO: 5966, and a schematic representation of a predicted secondary folding of GAM5697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5697 folded precursor RNA yielding a GAM5697 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5697 RNA, hereby incorporated herein.

GAM5697 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5697 target RNA, herein designated GAM TARGET RNA. GAM5697 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5697 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5697 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5697 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5697 RNA, herein designated GAM RNA, to target binding sites on GAM5697 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5697 target RNA into GAM5697 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5697 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5697 target genes. The mRNA of each one of this plurality of GAM5697 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5697 RNA, herein designated GAM RNA, and which when bound by GAM5697 RNA causes inhibition of translation of the GAM5697 target mRNA into a corresponding GAM5697 target protein.

The mechanism of the translational inhibition exerted by GAM5697 RNA, herein designated GAM RNA, on one or more GAM5697 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5697 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5697 RNA, herein designated GAM RNA, of GAM5697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5697 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5697 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5697 RNA correlate with, and may be deduced from, the identity of the GAM5697 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5703 6311 GACATGTCAA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGCAGGAGCC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATCTGATCGA Messenger 5703 (GAM5703) oligonucleotides modulates expression of respective target genes
CCTTAGACTT whose function and utility is known in the art.

GGCAAGCTGG GAM5703 is a novel bioinformatically detectable regulatory, non protein coding, TGGCTAAGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5703 was detected is

CAGTGCTCAC described with additional reference to Figs. 9-15.

TGCCGACATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTC encoded by the human genome.

GAM5703 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5703 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5703 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5703 precursor RNA is designated SEQ ID:6311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6311 is located from position 32944217 to position 32944300 relative to chromosome 19 on the `-` strand.

GAM5703 precursor RNA folds onto itself, forming GAM5703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5703 precursor RNA, designated SEQ ID NO: 6311, and a schematic representation of a predicted secondary folding of GAM5703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5703 folded precursor RNA yielding a GAM5703 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5703 RNA, hereby incorporated herein.

GAM5703 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5703 target RNA, herein designated GAM TARGET RNA. GAM5703 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5703 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5703 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM5703 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5703 RNA, herein designated GAM RNA, to target binding sites on GAM5703 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5703 target RNA into GAM5703 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5703 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5703 target genes. The mRNA of each one of this plurality of GAM5703 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5703 RNA, herein designated GAM RNA, and which when bound by GAM5703 RNA causes inhibition of translation of the GAM5703 target mRNA into a corresponding GAM5703 target protein.

The mechanism of the translational inhibition exerted by GAM5703 RNA, herein designated GAM RNA, on one or more GAM5703 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5703 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5703 RNA, herein designated GAM RNA, of GAM5703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5703 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5703 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5703 RNA correlate with, and may be deduced from, the identity of the GAM5703 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5728 6174 CTCTCATGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCATGTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address AGCAGCTGCA Messenger 5728 (GAM5728) oligonucleotides modulates expression of respective target genes GGTGTGTGAG whose function and utility is known in the art.

CAAATGTGCA GAM5728 is a novel bioinformatically detectable regulatory, non protein coding, TCACTGGGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5728 was detected is

ACAGGTGTCT described with additional reference to Figs. 9-15.

GTGGATGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene G encoded by the human genome.

GAM5728 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5728 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5728 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5728 precursor RNA is designated SEQ ID:6174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6174 is located from position 79169049 to position 79169129 relative to chromosome 10 on the `+` strand.

GAM5728 precursor RNA folds onto itself, forming GAM5728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5728 precursor RNA, designated SEQ ID NO: 6174, and a schematic representation of a predicted secondary folding of GAM5728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5728 folded precursor RNA yielding a GAM5728 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5728 RNA, hereby incorporated herein.

GAM5728 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5728 target RNA, herein designated GAM TARGET RNA. GAM5728 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5728 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5728 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5728 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5728 RNA, herein designated GAM RNA, to target binding sites on GAM5728 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5728 target RNA into GAM5728 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5728 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5728 target genes. The mRNA of each one of this plurality of GAM5728 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5728 RNA, herein designated GAM RNA, and which when bound by GAM5728 RNA causes inhibition of translation of the GAM5728 target mRNA into a corresponding GAM5728 target protein.

The mechanism of the translational inhibition exerted by GAM5728 RNA, herein designated GAM RNA, on one or more GAM5728 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5728 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5728 RNA, herein designated GAM RNA, of GAM5728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5728 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5728 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5728 RNA correlate with, and may be deduced from, the identity of the GAM5728 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5744 6979 TAGTGTTCAC Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGTTGCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTTTGCTAA Messenger 5744 (GAM5744) oligonucleotides modulates expression of respective target genes
CTGATAAATC whose function and utility is known in the art.

ATTTAATCCT GAM5744 is a novel bioinformatically detectable regulatory, non protein coding,
CTTCTTCATA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5744 was detected is

TGTATGAGTA described with additional reference to Figs. 9-15.

CTATCTTATA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTGTGGTCA encoded by the human genome.

AGAGTGAGGT GAM5744 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5744
AAGCAAGCTC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5744
CAACAGACCC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
TGAGAACCTA to the nucleotide sequence of GAM5744 precursor RNA is designated SEQ ID:6979, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6979 is located from position 901080 to position 901209 relative to chromosome 18 on the `+` strand.

GAM5744 precursor RNA folds onto itself, forming GAM5744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5744 precursor RNA, designated SEQ ID NO: 6979, and a schematic representation of a predicted secondary folding of GAM5744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5744 folded precursor RNA yielding a GAM5744 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5744 RNA, hereby incorporated herein.

GAM5744 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5744 target RNA, herein designated GAM TARGET RNA. GAM5744 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5744 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5744 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5744 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5744 RNA, herein designated GAM RNA, to target binding sites on GAM5744 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5744 target RNA into GAM5744 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5744 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5744 target genes. The mRNA of each one of this plurality of GAM5744 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5744 RNA, herein designated GAM RNA, and which when bound by GAM5744 RNA causes inhibition of translation of the GAM5744 target mRNA into a corresponding GAM5744 target protein.

The mechanism of the translational inhibition exerted by GAM5744 RNA, herein designated GAM RNA, on one or more GAM5744 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5744 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5744 RNA, herein designated GAM RNA, of GAM5744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM5744 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5744 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5744 RNA correlate with, and may be deduced from, the identity of the GAM5744 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5749 5824 AGTTCCTATG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCCCCACAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAAGCGCCC Messenger 5749 (GAM5749) oligonucleotides modulates expression of respective target genes
TTAACCACTG whose function and utility is known in the art.

ATGAGTGTTG GAM5749 is a novel bioinformatically detectable regulatory, non protein coding,
ATGTTTTTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5749 was detected is

GCACTAGAAG described with additional reference to Figs. 9-15.

GCACTATGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAACT encoded by the human genome.

GAM5749 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5749

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5749
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5749 precursor RNA is designated SEQ ID:5824, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5824 is located from position 18721900 to position 18721984 relative to chromosome 16 on the `-` strand.

GAM5749 precursor RNA folds onto itself, forming GAM5749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5749 precursor RNA, designated SEQ ID NO: 5824, and a schematic representation of a predicted secondary folding of GAM5749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5749 folded precursor RNA yielding a GAM5749 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5749 RNA, hereby incorporated herein.

GAM5749 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5749 target RNA, herein designated GAM TARGET RNA. GAM5749 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5749 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5749 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5749 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5749 RNA, herein designated GAM RNA, to target binding sites on GAM5749 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5749 target RNA into GAM5749 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5749 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5749 target genes. The mRNA of each one of this plurality of GAM5749 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5749 RNA, herein designated GAM RNA, and which when bound by GAM5749 RNA causes inhibition of translation of the GAM5749 target mRNA into a corresponding GAM5749 target protein.

The mechanism of the translational inhibition exerted by GAM5749 RNA, herein designated GAM RNA, on one or more GAM5749 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5749 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5749 RNA, herein designated GAM RNA, of

GAM5749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5749 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5749 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5749 RNA correlate with, and may be deduced from, the identity of the GAM5749 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5764 6586 GGACATCAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATAAATAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGCTCTAA Messenger 5764 (GAM5764) oligonucleotides modulates expression of respective target genes

TTGCCAAGAA whose function and utility is known in the art.

TTCACATGTG GAM5764 is a novel bioinformatically detectable regulatory, non protein coding,

GTTGTATGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5764 was detected is

GCTTTACTGG described with additional reference to Figs. 9-15.

GAGACTGAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTATCTGCA encoded by the human genome.

TGTGATTCTG GAM5764 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5764

CTGTGATGGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5764

CACTTGTAAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TTTGTGCC to the nucleotide sequence of GAM5764 precursor RNA is designated SEQ ID:6586, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6586 is located from position 62131098 to position 62131225 relative to chromosome 9 on the `-` strand.

GAM5764 precursor RNA folds onto itself, forming GAM5764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5764 precursor RNA, designated SEQ ID NO: 6586, and a

schematic representation of a predicted secondary folding of GAM5764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5764 folded precursor RNA yielding a GAM5764 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5764 RNA, hereby incorporated herein.

GAM5764 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5764 target RNA, herein designated GAM TARGET RNA. GAM5764 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5764 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5764 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5764 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5764 RNA, herein designated GAM RNA, to target binding sites on GAM5764 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5764 target RNA into GAM5764 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5764 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5764 target genes. The mRNA of each one of this plurality of GAM5764 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5764 RNA, herein designated GAM RNA, and which when bound by GAM5764 RNA causes inhibition of translation of the GAM5764 target mRNA into a corresponding GAM5764 target protein.

The mechanism of the translational inhibition exerted by GAM5764 RNA, herein designated GAM RNA, on one or more GAM5764 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5764 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5764 RNA, herein designated GAM RNA, of GAM5764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5764 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5764 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5764 RNA correlate with, and may be deduced from, the identity of the GAM5764 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5798 6055 CCAGGGAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGTAAGTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TATAGTTATC Messenger 5798 (GAM5798) oligonucleotides modulates expression of respective target genes

TTCTAATTGG whose function and utility is known in the art.

GGCCTAATAT GAM5798 is a novel bioinformatically detectable regulatory, non protein coding,

CCCTACCCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5798 was detected is

CAACAATACA described with additional reference to Figs. 9-15.

ACTTACTACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCACCCTGG encoded by the human genome.

GAM5798 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5798

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5798

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5798 precursor RNA is designated SEQ ID:6055, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6055 is located from position 52222704 to position 52222792 relative to chromosome X on the `+` strand.

GAM5798 precursor RNA folds onto itself, forming GAM5798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5798 precursor RNA, designated SEQ ID NO: 6055, and a schematic representation of a predicted secondary folding of GAM5798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5798 folded precursor RNA yielding a GAM5798 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5798 RNA, hereby incorporated herein.

GAM5798 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5798 target RNA, herein designated GAM TARGET RNA. GAM5798 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5798 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5798 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5798 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5798 RNA, herein designated GAM RNA, to target binding sites on GAM5798 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5798 target RNA into GAM5798 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5798 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5798 target genes. The mRNA of each one of this plurality of GAM5798 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5798 RNA, herein designated GAM RNA, and which when bound by GAM5798 RNA causes inhibition of translation of the GAM5798 target mRNA into a corresponding GAM5798 target protein.

The mechanism of the translational inhibition exerted by GAM5798 RNA, herein

designated GAM RNA, on one or more GAM5798 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5798 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5798 RNA, herein designated GAM RNA, of GAM5798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5798 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5798 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5798 RNA correlate with, and may be deduced from, the identity of the GAM5798 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGGGAAACA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5800 precursor RNA is designated SEQ ID:7280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7280 is located from position 35297121 to position 35297239 relative to chromosome 22

on the `+` strand.

GAM5800 precursor RNA folds onto itself, forming GAM5800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5800 precursor RNA, designated SEQ ID NO: 7280, and a schematic representation of a predicted secondary folding of GAM5800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5800 folded precursor RNA yielding a GAM5800 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5800 RNA, hereby incorporated herein.

GAM5800 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5800 target RNA, herein designated GAM TARGET RNA. GAM5800 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5800 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5800 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5800 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5800 RNA, herein designated GAM RNA, to target binding sites on GAM5800 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5800 target RNA into GAM5800 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5800 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5800 target genes. The mRNA of each one of this plurality of GAM5800 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM5800 RNA, herein designated GAM RNA, and which when bound by GAM5800 RNA causes inhibition of translation of the GAM5800 target mRNA into a corresponding GAM5800 target protein.

The mechanism of the translational inhibition exerted by GAM5800 RNA, herein designated GAM RNA, on one or more GAM5800 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5800 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5800 RNA, herein designated GAM RNA, of GAM5800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5800 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5800 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5800 RNA correlate with, and may be deduced from, the identity of the GAM5800 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5806 7270 TGTGAGCTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAGGAGTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCCTGAGTC Messenger 5806 (GAM5806) oligonucleotides modulates expression of respective target genes

TGTGGGTCAT whose function and utility is known in the art.

CTAGCACATC GAM5806 is a novel bioinformatically detectable regulatory, non protein coding,

CTTAATAGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5806 was detected is

TGATTGCCTG described with additional reference to Figs. 9-15.

GATGTGACCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCTCACCCC encoded by the human genome.

CAACCCTCAC GAM5806 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5806

ACA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5806

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5806 precursor RNA is designated SEQ ID:7270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7270 is located from position 23608784 to position 23608886 relative to chromosome 16 on the `+` strand.

GAM5806 precursor RNA folds onto itself, forming GAM5806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5806 precursor RNA, designated SEQ ID NO: 7270, and a schematic representation of a predicted secondary folding of GAM5806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5806 folded precursor RNA yielding a GAM5806 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5806 RNA, hereby incorporated herein.

GAM5806 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5806 target RNA, herein designated GAM TARGET RNA. GAM5806 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5806 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5806 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5806 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5806 RNA, herein designated GAM RNA, to target binding sites on GAM5806 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5806 target RNA into GAM5806 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5806 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5806 target genes. The mRNA of each one of this plurality of GAM5806 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5806 RNA, herein designated GAM RNA, and which when bound by GAM5806 RNA causes inhibition of translation of the GAM5806 target mRNA into a corresponding GAM5806 target protein.

The mechanism of the translational inhibition exerted by GAM5806 RNA, herein designated GAM RNA, on one or more GAM5806 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5806 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5806 RNA, herein designated GAM RNA, of GAM5806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5806 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5806 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5806 RNA correlate with, and may be deduced from, the identity of the GAM5806 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5809 7307 TTCTGTCTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAATTCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
CGTGACTGGG Messenger 5809 (GAM5809) oligonucleotides modulates expression of respective target genes
GCTAAACAAC whose function and utility is known in the art.

TGTCACTGGC GAM5809 is a novel bioinformatically detectable regulatory, non protein coding,
AAGTGACAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5809 was detected is

AGGCACAGAC described with additional reference to Figs. 9-15.

AGCAGGGGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATAAAAAGAG encoded by the human genome.

AGAA GAM5809 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5809 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5809 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5809 precursor RNA is designated SEQ ID:7307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7307 is located from position 114373899 to position 114373992 relative to chromosome 10 on the `+` strand.

GAM5809 precursor RNA folds onto itself, forming GAM5809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5809 precursor RNA, designated SEQ ID NO: 7307, and a schematic representation of a predicted secondary folding of GAM5809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5809 folded precursor RNA yielding a GAM5809 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5809 RNA, hereby incorporated herein.

GAM5809 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5809 target RNA, herein designated GAM TARGET RNA. GAM5809 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5809 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5809 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5809 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5809 RNA, herein designated GAM RNA, to target binding sites on GAM5809 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5809 target RNA into GAM5809 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5809 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5809 target genes. The mRNA of each one of this plurality of GAM5809 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5809 RNA, herein designated GAM RNA, and which when bound by GAM5809 RNA causes inhibition of translation of the GAM5809 target mRNA into a corresponding GAM5809 target protein.

The mechanism of the translational inhibition exerted by GAM5809 RNA, herein designated GAM RNA, on one or more GAM5809 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5809 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5809 RNA, herein designated GAM RNA, of GAM5809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5809 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5809 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5809 RNA correlate with, and may be deduced from, the identity of the GAM5809 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATTTCCTTTT Messenger 5814 (GAM5814) oligonucleotides modulates expression of respective target genes
CTCTGCGTCG whose function and utility is known in the art.

AAATGTCAAG GAM5814 is a novel bioinformatically detectable regulatory, non protein coding,
GAAAGTTGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5814 was detected is

AGTCTGTGAT described with additional reference to Figs. 9-15.

TTTGTGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM5814 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5814 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5814 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5814 precursor RNA is designated SEQ ID:5719, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5719 is located from position 58108888 to position 58108966 relative to chromosome 20 on the `+` strand.

GAM5814 precursor RNA folds onto itself, forming GAM5814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5814 precursor RNA, designated SEQ ID NO: 5719, and a schematic representation of a predicted secondary folding of GAM5814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5814 folded precursor RNA yielding a GAM5814 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5814 RNA, hereby incorporated herein.

GAM5814 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5814 target RNA, herein designated GAM TARGET RNA. GAM5814 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5814 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5814 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5814 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5814 RNA, herein designated GAM RNA, to target binding sites on GAM5814 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5814 target RNA into GAM5814 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5814 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5814 target genes. The mRNA of each one of this plurality of GAM5814 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5814 RNA, herein designated GAM RNA, and which when bound by GAM5814 RNA causes inhibition of translation of the GAM5814 target mRNA into a corresponding GAM5814 target protein.

The mechanism of the translational inhibition exerted by GAM5814 RNA, herein designated GAM RNA, on one or more GAM5814 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5814 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5814 RNA, herein designated GAM RNA, of GAM5814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5814 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5814 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5814 RNA correlate with, and may be deduced from, the identity of the GAM5814 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5823 6964 TAGAAATATG TAATCGATCT TTTCTTTGGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 5823 (GAM5823) oligonucleotides modulates expression of respective target genes

GGGCAATTAG whose function and utility is known in the art.

CAATATTGAG GAM5823 is a novel bioinformatically detectable regulatory, non protein coding, GAAAGTTAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5823 was detected is

GATGTATGTA described with additional reference to Figs. 9-15.

TCCCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5823 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5823

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5823

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5823 precursor RNA is designated SEQ ID:6964, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6964 is located from position 7772036 to position 7772111 relative to chromosome X on the `-` strand.

GAM5823 precursor RNA folds onto itself, forming GAM5823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5823 precursor RNA, designated SEQ ID NO: 6964, and a schematic representation of a predicted secondary folding of GAM5823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5823 folded precursor RNA yielding a GAM5823 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. TCTGTCAGGT Messenger 5826 (GAM5826) oligonucleotides modulates expression of respective target genes
TCCAAAGAGC whose function and utility is known in the art.

GCCAGGAAGA GAM5826 is a novel bioinformatically detectable regulatory, non protein coding,
CTCTGAGACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5826 was detected is

ACAGAGCACG described with additional reference to Figs. 9-15.

GCCTGCTTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCCCAGCC encoded by the human genome.

GAM5826 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5826

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5826
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5826 precursor RNA is designated SEQ ID:6765, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6765 is located from position 492716 to position 492803 relative to chromosome 16 on the `+` strand.

GAM5826 precursor RNA folds onto itself, forming GAM5826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5826 precursor RNA, designated SEQ ID NO: 6765, and a schematic representation of a predicted secondary folding of GAM5826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5826 folded precursor RNA yielding a GAM5826 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5826 RNA, hereby incorporated herein.

GAM5826 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5826 target RNA, herein designated GAM TARGET RNA. GAM5826 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5826 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5826 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5826 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5826 RNA, herein designated GAM RNA, to target binding sites on GAM5826 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5826 target RNA into GAM5826 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5826 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5826 target genes. The mRNA of each one of this plurality of GAM5826 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5826 RNA, herein designated GAM RNA, and which when bound by GAM5826 RNA causes inhibition of translation of the GAM5826 target mRNA into a corresponding GAM5826 target protein.

The mechanism of the translational inhibition exerted by GAM5826 RNA, herein designated GAM RNA, on one or more GAM5826 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5826 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5826 RNA, herein designated GAM RNA, of GAM5826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5826 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5826 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5826 RNA correlate with, and may be deduced from, the identity of the GAM5826 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5836 5829 AGTTTCACTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTCACCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCTGGAGTG Messenger 5836 (GAM5836) oligonucleotides modulates expression of respective target genes

CAGTGGTGCC whose function and utility is known in the art.

ATCTTGGCTC GAM5836 is a novel bioinformatically detectable regulatory, non protein coding,

ACTGCAACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5836 was detected is

CCGCCTGCCG described with additional reference to Figs. 9-15.

AGTTCAAGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATTCT encoded by the human genome.

GAM5836 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5836

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5836

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5836 precursor RNA is designated SEQ ID:5829, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5829 is located from position 232531653 to position 232531737 relative to chromosome 2 on the `+` strand.

GAM5836 precursor RNA folds onto itself, forming GAM5836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5836 precursor RNA, designated SEQ ID NO: 5829, and a schematic representation of a predicted secondary folding of GAM5836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5836 folded precursor RNA yielding a GAM5836 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5836 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5836 RNA and an

alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5836 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5836 target RNA, herein designated GAM TARGET RNA. GAM5836 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5836 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5836 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5836 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5836 RNA, herein designated GAM RNA, to target binding sites on GAM5836 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5836 target RNA into GAM5836 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5836 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5836 target genes. The mRNA of each one of this plurality of GAM5836 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5836 RNA, herein designated GAM RNA, and which when bound by GAM5836 RNA causes inhibition of translation of the GAM5836 target mRNA into a corresponding GAM5836 target protein.

The mechanism of the translational inhibition exerted by GAM5836 RNA, herein designated GAM RNA, on one or more GAM5836 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5836 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5836 RNA, herein designated GAM RNA, of GAM5836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5836 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5836 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5836 RNA correlate with, and may be deduced from, the identity of the GAM5836 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5859 6447 GAGGGCTGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCATTAGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCTCGGAGC Messenger 5859 (GAM5859) oligonucleotides modulates expression of respective target genes

TGGGAGAAGT whose function and utility is known in the art.

CCCTGAGCCC GAM5859 is a novel bioinformatically detectable regulatory, non protein coding,

TGAAGGGTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5859 was detected is

TTTGGGCAGT described with additional reference to Figs. 9-15.

ATGTGACAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTC encoded by the human genome.

GAM5859 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5859

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5859

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5859 precursor RNA is designated SEQ ID:6447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6447 is located from position 120684537 to position 120684620 relative to chromosome 8 on the `+` strand.

GAM5859 precursor RNA folds onto itself, forming GAM5859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5859 precursor RNA, designated SEQ ID NO: 6447, and a schematic representation of a predicted secondary folding of GAM5859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5859 folded precursor RNA

yielding a GAM5859 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5859 RNA, hereby incorporated herein.

GAM5859 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5859 target RNA, herein designated GAM TARGET RNA. GAM5859 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5859 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5859 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5859 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5859 RNA, herein designated GAM RNA, to target binding sites on GAM5859 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5859 target RNA into GAM5859 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5859 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5859 target genes. The mRNA of each one of this plurality of GAM5859 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5859 RNA, herein designated GAM RNA, and which when bound by GAM5859 RNA causes inhibition of translation of the GAM5859 target mRNA into a corresponding GAM5859 target protein.

The mechanism of the translational inhibition exerted by GAM5859 RNA, herein designated GAM RNA, on one or more GAM5859 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5859 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5859 RNA, herein designated GAM RNA, of GAM5859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5859 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5859 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5859 RNA correlate with, and may be deduced from, the identity of the GAM5859 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5868 6037 CATCACCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGTTCTCTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCAACAGAC Messenger 5868 (GAM5868) oligonucleotides modulates expression of respective target genes

ATGTCCAGTG whose function and utility is known in the art.

GACCGTAGTG GAM5868 is a novel bioinformatically detectable regulatory, non protein coding,

TTGTGACGGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5868 was detected is

CGCCCATCTG described with additional reference to Figs. 9-15.

CGCCCAGTAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTCGGATCAT encoded by the human genome.

GCGGAACATG GAM5868 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5868

TTGTCAAAGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5868

TGCAGATTGC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

CTGTGACAAC to the nucleotide sequence of GAM5868 precursor RNA is designated SEQ ID:6037, and is

G provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6037 is located from position 56320934 to position 56321064 relative to chromosome 12 on the `-` strand.

GAM5868 precursor RNA folds onto itself, forming GAM5868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5868 precursor RNA, designated SEQ ID NO: 6037, and a schematic representation of a predicted secondary folding of GAM5868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5868 folded precursor RNA yielding a GAM5868 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5868 RNA, hereby incorporated herein.

GAM5868 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5868 target RNA, herein designated GAM TARGET RNA. GAM5868 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5868 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5868 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5868 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5868 RNA, herein designated GAM RNA, to target binding sites on GAM5868 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5868 target RNA into GAM5868 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5868 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5868 target genes. The mRNA of each one of this plurality of GAM5868 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5868 RNA, herein designated GAM RNA, and which when bound by GAM5868 RNA causes inhibition of translation of the GAM5868 target mRNA into a corresponding GAM5868 target protein.

The mechanism of the translational inhibition exerted by GAM5868 RNA, herein designated GAM RNA, on one or more GAM5868 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5868 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5868 RNA, herein designated GAM RNA, of GAM5868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5868 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5868 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5868 RNA correlate with, and may be deduced from, the identity of the GAM5868 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5872 6941 GTTTAAATGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTATCCGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAATTCCTGT Messenger 5872 (GAM5872) oligonucleotides modulates expression of respective target genes

TGTGTGGAAG whose function and utility is known in the art.

ATGCTTTGCC GAM5872 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTCTTCAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5872 was detected is

CTGGAAATCA described with additional reference to Figs. 9-15.

TTTTTCCATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTTTAGGTCA encoded by the human genome.

CAGCTTAAAC GAM5872 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5872

ATGATTTTCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5872

CAGGAATTTT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TCTCTGACCA to the nucleotide sequence of GAM5872 precursor RNA is designated SEQ ID:6941, and is

C provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6941 is located from position 78069309 to position 78069439 relative to chromosome 7 on the `+` strand.

GAM5872 precursor RNA folds onto itself, forming GAM5872 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5872 precursor RNA, designated SEQ ID NO: 6941, and a schematic representation of a predicted secondary folding of GAM5872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5872 folded precursor RNA yielding a GAM5872 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5872 RNA, hereby incorporated herein.

GAM5872 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5872 target RNA, herein designated GAM TARGET RNA. GAM5872 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5872 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5872 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5872 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5872 RNA, herein designated GAM RNA, to target binding sites on GAM5872 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5872 target RNA into GAM5872 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5872 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5872 target genes. The mRNA of each one of this plurality of GAM5872 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5872 RNA, herein designated GAM RNA, and which when bound by GAM5872 RNA causes inhibition of translation of the GAM5872 target mRNA into a corresponding GAM5872 target protein.

The mechanism of the translational inhibition exerted by GAM5872 RNA, herein designated GAM RNA, on one or more GAM5872 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5872 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5872 RNA, herein designated GAM RNA, of GAM5872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5872 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5872 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5872 RNA correlate with, and may be deduced from, the identity of the GAM5872 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5874 6244 CTGTGCTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GATAACAGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTTTGAGGG Messenger 5874 (GAM5874) oligonucleotides modulates expression of respective target genes

ACAACTTTCA whose function and utility is known in the art.

CATTTGAGTT GAM5874 is a novel bioinformatically detectable regulatory, non protein coding,

TTTCCAAAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5874 was detected is

TAAAGGTTGT described with additional reference to Figs. 9-15.

AGAAGAGTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAG encoded by the human genome.

GAM5874 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5874

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5874

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5874 precursor RNA is designated SEQ ID:6244, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6244 is located from position 31954910 to position 31954992 relative to chromosome 21 on the `+` strand.

GAM5874 precursor RNA folds onto itself, forming GAM5874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5874 precursor RNA, designated SEQ ID NO: 6244, and a schematic representation of a predicted secondary folding of GAM5874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5874 folded precursor RNA yielding a GAM5874 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5874 RNA, hereby incorporated herein.

GAM5874 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5874 target RNA, herein designated GAM TARGET RNA. GAM5874 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5874 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5874 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5874 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5874 RNA, herein designated GAM RNA, to target binding sites on GAM5874 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5874 target RNA into GAM5874 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5874 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM5874 target genes. The mRNA of each one of this plurality of GAM5874 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5874 RNA, herein designated GAM RNA, and which when bound by GAM5874 RNA causes inhibition of translation of the GAM5874 target mRNA into a corresponding GAM5874 target protein.

The mechanism of the translational inhibition exerted by GAM5874 RNA, herein designated GAM RNA, on one or more GAM5874 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5874 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5874 RNA, herein designated GAM RNA, of GAM5874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5874 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5874 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5874 RNA correlate with, and may be deduced from, the identity of the GAM5874 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5884 6796 GGGATAGCTC Fig. 8 further provides a conceptual description of another novel bioinformatically
ATTTTTGAAA detected oligonucleotides of the present invention, referred to here as Genomic Address
TCAGTTTAGA Messenger 5884 (GAM5884) oligonucleotides modulates expression of respective target genes
ACATTTAAAA whose function and utility is known in the art.

TGTGGGAAAT GAM5884 is a novel bioinformatically detectable regulatory, non protein coding,
TCAAATAAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5884 was detected is

ATGCAAATTT described with additional reference to Figs. 9-15.

TCACTGTTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTAAAAAGTC encoded by the human genome.

AGATCAACAT GAM5884 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5884

TGCTGGCCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5884 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5884 precursor RNA is designated SEQ ID:6796, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6796 is located from position 65430589 to position 65430697 relative to chromosome 14 on the `+` strand.

GAM5884 precursor RNA folds onto itself, forming GAM5884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5884 precursor RNA, designated SEQ ID NO: 6796, and a schematic representation of a predicted secondary folding of GAM5884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5884 folded precursor RNA yielding a GAM5884 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5884 RNA, hereby incorporated herein.

GAM5884 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5884 target RNA, herein designated GAM TARGET RNA. GAM5884 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5884 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5884 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5884 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5884 RNA, herein designated GAM RNA, to target binding sites on GAM5884 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5884 target RNA

into GAM5884 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5884 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5884 target genes. The mRNA of each one of this plurality of GAM5884 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5884 RNA, herein designated GAM RNA, and which when bound by GAM5884 RNA causes inhibition of translation of the GAM5884 target mRNA into a corresponding GAM5884 target protein.

The mechanism of the translational inhibition exerted by GAM5884 RNA, herein designated GAM RNA, on one or more GAM5884 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5884 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5884 RNA, herein designated GAM RNA, of GAM5884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5884 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5884 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5884 RNA correlate with, and may be deduced from, the identity of the GAM5884 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5886 6772 GGCTTTATCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTGCCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTCCTACAT Messenger 5886 (GAM5886) oligonucleotides modulates expression of respective target genes

TATCAACAAA whose function and utility is known in the art.

GTGAGAGTTT GAM5886 is a novel bioinformatically detectable regulatory, non protein coding,

AAGATCTCCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5886 was detected is

GGGCAGGAGA described with additional reference to Figs. 9-15.

TTTCAGAAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

C encoded by the human genome.

GAM5886 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5886 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5886 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5886 precursor RNA is designated SEQ ID:6772, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6772 is located from position 101743923 to position 101744003 relative to chromosome 10 on the `+` strand.

GAM5886 precursor RNA folds onto itself, forming GAM5886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5886 precursor RNA, designated SEQ ID NO: 6772, and a schematic representation of a predicted secondary folding of GAM5886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5886 folded precursor RNA yielding a GAM5886 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5886 RNA, hereby incorporated herein.

GAM5886 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5886 target RNA, herein designated GAM TARGET RNA. GAM5886 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5886 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5886 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5886 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5886 RNA, herein designated GAM RNA, to target binding sites on GAM5886 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5886 target RNA into GAM5886 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5886 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5886 target genes. The mRNA of each one of this plurality of GAM5886 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5886 RNA, herein designated GAM RNA, and which when bound by GAM5886 RNA causes inhibition of translation of the GAM5886 target mRNA into a corresponding GAM5886 target protein.

The mechanism of the translational inhibition exerted by GAM5886 RNA, herein designated GAM RNA, on one or more GAM5886 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5886 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5886 RNA, herein designated GAM RNA, of GAM5886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5886 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5886 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5886 RNA correlate with, and may be deduced from, the identity of the GAM5886 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5910 7087 TGAATCACTG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGAAAACAT detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGTAATTCA Messenger 5910 (GAM5910) oligonucleotides modulates expression of respective target genes
ACAACCTTGC whose function and utility is known in the art.

TGCTGACCTC GAM5910 is a novel bioinformatically detectable regulatory, non protein coding,
TTATTCAGTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM5910 was detected is

AAATGAGAGC described with additional reference to Figs. 9-15.

AAGTGTTGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGCTGGTG encoded by the human genome.

GTGGTTCACA GAM5910 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5910

TCAAAATCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5910

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5910 precursor RNA is designated SEQ ID:7087, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7087 is located from position 24156183 to position 24156291 relative to chromosome 22 on the `-` strand.

GAM5910 precursor RNA folds onto itself, forming GAM5910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5910 precursor RNA, designated SEQ ID NO: 7087, and a schematic representation of a predicted secondary folding of GAM5910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5910 folded precursor RNA yielding a GAM5910 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5910 RNA, hereby incorporated herein.

GAM5910 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5910 target RNA, herein designated GAM TARGET RNA. GAM5910 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5910 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5910 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5910 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5910 RNA, herein designated GAM RNA, to target binding sites on GAM5910 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5910 target RNA into GAM5910 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5910 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5910 target genes. The mRNA of each one of this plurality of GAM5910 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5910 RNA, herein designated GAM RNA, and which when bound by GAM5910 RNA causes inhibition of translation of the GAM5910 target mRNA into a corresponding GAM5910 target protein.

The mechanism of the translational inhibition exerted by GAM5910 RNA, herein designated GAM RNA, on one or more GAM5910 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5910 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5910 RNA, herein designated GAM RNA, of GAM5910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5910 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5910 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5910 RNA correlate with, and may be deduced from, the identity of the GAM5910 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5916 6237 CTGTACAAAG CAGCCTTGGA CCAGGAGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 5916 (GAM5916) oligonucleotides modulates expression of respective target genes

AAACCCCAAG whose function and utility is known in the art.

GCTCTGCAGC GAM5916 is a novel bioinformatically detectable regulatory, non protein coding,
CTCCCTGCTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5916 was detected is

CCCTCCGTTT described with additional reference to Figs. 9-15.

AAGGCTGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCAG encoded by the human genome.

GAM5916 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5916

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5916

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5916 precursor RNA is designated SEQ ID:6237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6237 is located from position 3852983 to position 3853066 relative to chromosome 20 on the `+` strand.

GAM5916 precursor RNA folds onto itself, forming GAM5916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5916 precursor RNA, designated SEQ ID NO: 6237, and a schematic representation of a predicted secondary folding of GAM5916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5916 folded precursor RNA yielding a GAM5916 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5916 RNA, hereby incorporated herein.

GAM5916 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5916 target RNA, herein designated GAM TARGET RNA. GAM5916 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5916 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5916 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5916 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5916 RNA, herein designated GAM RNA, to target binding sites on GAM5916 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5916 target RNA into GAM5916 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5916 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5916 target genes. The mRNA of each one of this plurality of GAM5916 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5916 RNA, herein designated GAM RNA, and which when bound by GAM5916 RNA causes inhibition of translation of the GAM5916 target mRNA into a corresponding GAM5916 target protein.

The mechanism of the translational inhibition exerted by GAM5916 RNA, herein designated GAM RNA, on one or more GAM5916 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5916 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

CTGAGGACCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTAGGTCAGA Messenger 5963 (GAM5963) oligonucleotides modulates expression of respective target genes

CAGAGAAGCT whose function and utility is known in the art.

TTCTCTTTCT GAM5963 is a novel bioinformatically detectable regulatory, non protein coding,

GATGGGAAGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5963 was detected is

GTCAAAGTGG described with additional reference to Figs. 9-15.

AAATCTCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM5963 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5963

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5963

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5963 precursor RNA is designated SEQ ID:5672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5672 is located from position 126883041 to position 126883119 relative to chromosome X on the `-` strand.

GAM5963 precursor RNA folds onto itself, forming GAM5963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5963 precursor RNA, designated SEQ ID NO: 5672, and a schematic representation of a predicted secondary folding of GAM5963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5963 folded precursor RNA yielding a GAM5963 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5963 RNA, hereby incorporated herein.

GAM5963 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5963 target RNA, herein designated GAM TARGET RNA. GAM5963 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5963 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5963 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5963 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5963 RNA, herein designated GAM RNA, to target binding sites on GAM5963 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5963 target RNA into GAM5963 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5963 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5963 target genes. The mRNA of each one of this plurality of GAM5963 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5963 RNA, herein designated GAM RNA, and which when bound by GAM5963 RNA causes inhibition of translation of the GAM5963 target mRNA into a corresponding GAM5963 target protein.

The mechanism of the translational inhibition exerted by GAM5963 RNA, herein designated GAM RNA, on one or more GAM5963 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5963 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5963 RNA, herein designated GAM RNA, of GAM5963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM5963 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5963 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5963 RNA correlate with, and may be deduced from, the identity of the GAM5963 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5971 6005 CACTGTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGTAAGGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAATGTTCT Messenger 5971 (GAM5971) oligonucleotides modulates expression of respective target genes
TTTTCAAAAA whose function and utility is known in the art.

TAGTCTGAGC GAM5971 is a novel bioinformatically detectable regulatory, non protein coding,
CAATTGGATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5971 was detected is

TTTTTGTGGA described with additional reference to Figs. 9-15.

ATATTTTTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AATTTGCCCT encoded by the human genome.

GCATGTG GAM5971 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5971
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5971
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5971 precursor RNA is designated SEQ ID:6005, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6005 is located from position 10754212 to position 10754308 relative to chromosome 9 on the `-` strand.

GAM5971 precursor RNA folds onto itself, forming GAM5971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5971 precursor RNA, designated SEQ ID NO: 6005, and a schematic representation of a predicted secondary folding of GAM5971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5971 folded precursor RNA yielding a GAM5971 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5971 RNA, hereby incorporated herein.

GAM5971 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5971 target RNA, herein designated GAM TARGET RNA. GAM5971 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5971 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5971 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5971 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5971 RNA, herein designated GAM RNA, to target binding sites on GAM5971 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5971 target RNA into GAM5971 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5971 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5971 target genes. The mRNA of each one of this plurality of GAM5971 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5971 RNA, herein designated GAM RNA, and which when bound by GAM5971 RNA causes inhibition of translation of the GAM5971 target mRNA into a corresponding GAM5971 target protein.

The mechanism of the translational inhibition exerted by GAM5971 RNA, herein designated GAM RNA, on one or more GAM5971 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5971 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5971 RNA, herein designated GAM RNA, of

GAM5971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5971 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5971 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5971 RNA correlate with, and may be deduced from, the identity of the GAM5971 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5973 7222 TGGAGTATTT Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGAGTGACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TAAACAACAG Messenger 5973 (GAM5973) oligonucleotides modulates expression of respective target genes
ATGTTCATAC whose function and utility is known in the art.

TCTGCCAGTT GAM5973 is a novel bioinformatically detectable regulatory, non protein coding,
CTGGAGGTTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM5973 was detected is

GAAAGTCCAA described with additional reference to Figs. 9-15.

GATCAGGGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTGGCAGATT encoded by the human genome.

TGGTTGCTGT GAM5973 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5973
TGGGTTCTCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5973
TCTTGGCTCG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CA to the nucleotide sequence of GAM5973 precursor RNA is designated SEQ ID:7222, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7222 is located from position 42645831 to position 42645952 relative to chromosome 22 on the `+` strand.

GAM5973 precursor RNA folds onto itself, forming GAM5973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5973 precursor RNA, designated SEQ ID NO: 7222, and a schematic representation of a predicted secondary folding of GAM5973 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5973 folded precursor RNA yielding a GAM5973 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5973 RNA, hereby incorporated herein.

GAM5973 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5973 target RNA, herein designated GAM TARGET RNA. GAM5973 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5973 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5973 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5973 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5973 RNA, herein designated GAM RNA, to target binding sites on GAM5973 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5973 target RNA into GAM5973 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5973 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5973 target genes. The mRNA of each one of this plurality of GAM5973 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5973 RNA, herein designated GAM RNA, and which when bound by GAM5973 RNA causes inhibition of translation of the GAM5973 target mRNA into a corresponding GAM5973 target protein.

The mechanism of the translational inhibition exerted by GAM5973 RNA, herein designated GAM RNA, on one or more GAM5973 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5973 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM5973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5973 RNA, herein designated GAM RNA, of GAM5973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5973 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5973 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5973 RNA correlate with, and may be deduced from, the identity of the GAM5973 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5990 7241 TGGGGGCACT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTTCTGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTTGCTCTTT Messenger 5990 (GAM5990) oligonucleotides modulates expression of respective target genes

CTTCTGGAAA whose function and utility is known in the art.

CATTATTCTG GAM5990 is a novel bioinformatically detectable regulatory, non protein coding,

TTCCTTTGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM5990 was detected is

CATGGGCAAG described with additional reference to Figs. 9-15.

GGTCCTGTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTA encoded by the human genome.

GAM5990 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5990

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5990

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5990 precursor RNA is designated SEQ ID:7241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7241 is located from position 30850318 to position 30850400 relative to chromosome 6 on the `+` strand.

GAM5990 precursor RNA folds onto itself, forming GAM5990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5990 precursor RNA, designated SEQ ID NO: 7241, and a schematic representation of a predicted secondary folding of GAM5990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5990 folded precursor RNA yielding a GAM5990 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM5990 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5990 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM5990 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5990 target RNA, herein designated GAM TARGET RNA. GAM5990 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5990 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5990 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5990 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5990 RNA, herein designated GAM RNA, to target binding sites on GAM5990 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5990 target RNA into GAM5990 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5990 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5990 target genes. The mRNA of each one of this plurality of GAM5990 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM5990 RNA, herein designated GAM RNA, and which when bound by GAM5990 RNA causes inhibition of translation of the GAM5990 target mRNA into a corresponding GAM5990 target protein.

The mechanism of the translational inhibition exerted by GAM5990 RNA, herein

designated GAM RNA, on one or more GAM5990 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5990 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5990 RNA, herein designated GAM RNA, of GAM5990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5990 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5990 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5990 RNA correlate with, and may be deduced from, the identity of the GAM5990 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM5998 6129 CCTTGGCCCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGAGGCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCTCTTGAG Messenger 5998 (GAM5998) oligonucleotides modulates expression of respective target genes
CCTGAGAAGC whose function and utility is known in the art.

AGAGGTGACA GAM5998 is a novel bioinformatically detectable regulatory, non protein coding,
GTACTGGCCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM5998 was detected is

TGGTTCTTAG described with additional reference to Figs. 9-15.

CAGGGGGGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCGGGCAGGG encoded by the human genome.

TAGGGG GAM5998 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM5998
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM5998
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM5998 precursor RNA is designated SEQ ID:6129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6129 is located from position 30012813 to position 30012908 relative to chromosome 16

on the `+` strand.

GAM5998 precursor RNA folds onto itself, forming GAM5998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM5998 precursor RNA, designated SEQ ID NO: 6129, and a schematic representation of a predicted secondary folding of GAM5998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM5998 folded precursor RNA yielding a GAM5998 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM5998 RNA, hereby incorporated herein.

GAM5998 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM5998 target RNA, herein designated GAM TARGET RNA. GAM5998 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM5998 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM5998 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM5998 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM5998 RNA, herein designated GAM RNA, to target binding sites on GAM5998 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM5998 target RNA into GAM5998 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM5998 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM5998 target genes. The mRNA of each one of this plurality of GAM5998 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM5998 RNA, herein designated GAM RNA, and which when bound by GAM5998 RNA causes inhibition of translation of the GAM5998 target mRNA into a corresponding GAM5998 target protein.

The mechanism of the translational inhibition exerted by GAM5998 RNA, herein designated GAM RNA, on one or more GAM5998 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM5998 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM5998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM5998 RNA, herein designated GAM RNA, of GAM5998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM5998 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM5998 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM5998 RNA correlate with, and may be deduced from, the identity of the GAM5998 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6014 6740 GGCATGGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGCCTTGATT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTAATGTTT Messenger 6014 (GAM6014) oligonucleotides modulates expression of respective target genes
GCTAATTTAC whose function and utility is known in the art.

GTGGTACAAG GAM6014 is a novel bioinformatically detectable regulatory, non protein coding,
TGCTCCAGTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6014 was detected is

CGGCC described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM6014 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6014

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6014

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6014 precursor RNA is designated SEQ ID:6740, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6740 is located from position 21850242 to position 21850306 relative to chromosome 9 on the `+` strand.

GAM6014 precursor RNA folds onto itself, forming GAM6014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6014 precursor RNA, designated SEQ ID NO: 6740, and a schematic representation of a predicted secondary folding of GAM6014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6014 folded precursor RNA yielding a GAM6014 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6014 RNA, hereby incorporated herein.

GAM6014 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6014 target RNA, herein designated GAM TARGET RNA. GAM6014 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6014 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6014 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6014 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6014 RNA, herein designated GAM RNA, to target binding sites on GAM6014 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6014 target RNA into GAM6014 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6014 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6014 target genes. The mRNA of each one of this plurality of GAM6014 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6014 RNA, herein designated GAM RNA, and which when bound by GAM6014 RNA causes inhibition of translation of the GAM6014 target mRNA into a corresponding GAM6014 target protein.

The mechanism of the translational inhibition exerted by GAM6014 RNA, herein designated GAM RNA, on one or more GAM6014 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6014 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6014 RNA, herein designated GAM RNA, of GAM6014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6014 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6014 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6014 RNA correlate with, and may be deduced from, the identity of the GAM6014 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6024 6285 GAAATGTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATTAAAAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGTAGTGAG Messenger 6024 (GAM6024) oligonucleotides modulates expression of respective target genes

GCTGGCATTT whose function and utility is known in the art.

ATAGAATCTG GAM6024 is a novel bioinformatically detectable regulatory, non protein coding,

GCTTTCTTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6024 was detected is

ATTGGGTGGA described with additional reference to Figs. 9-15.

AAGCTAGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAACCAGTTT encoded by the human genome.

CTCTCAGCCT GAM6024 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6024
TTTCTCTCCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6024
CAGGTC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6024 precursor RNA is designated SEQ ID:6285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6285 is located from position 116757829 to position 116757944 relative to chromosome 9 on the `-` strand.

GAM6024 precursor RNA folds onto itself, forming GAM6024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6024 precursor RNA, designated SEQ ID NO: 6285, and a schematic representation of a predicted secondary folding of GAM6024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6024 folded precursor RNA yielding a GAM6024 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6024 RNA, hereby incorporated herein.

GAM6024 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6024 target RNA, herein designated GAM TARGET RNA. GAM6024 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6024 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6024 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6024 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6024 RNA, herein designated GAM RNA, to target binding sites on GAM6024 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6024 target RNA into GAM6024 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6024 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6024 target genes. The mRNA of each one of this plurality of GAM6024 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6024 RNA, herein designated GAM RNA, and which when bound by GAM6024 RNA causes inhibition of translation of the GAM6024 target mRNA into a corresponding GAM6024 target protein.

The mechanism of the translational inhibition exerted by GAM6024 RNA, herein designated GAM RNA, on one or more GAM6024 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6024 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6024 RNA, herein designated GAM RNA, of GAM6024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6024 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6024 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6024 RNA correlate with, and may be deduced from, the identity of the GAM6024 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6051 5706 ACTCTTGAGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCCCTCCACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGAGGACG Messenger 6051 (GAM6051) oligonucleotides modulates expression of respective target genes
TTTCCTGACA whose function and utility is known in the art.

CATTCAACAG GAM6051 is a novel bioinformatically detectable regulatory, non protein coding,
CATCAGCGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6051 was detected is

CAATCAGGAG described with additional reference to Figs. 9-15.

GGAGCTCAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGT encoded by the human genome.

GAM6051 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6051 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6051 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6051 precursor RNA is designated SEQ ID:5706, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5706 is located from position 62941952 to position 62942035 relative to chromosome 14 on the `-` strand.

GAM6051 precursor RNA folds onto itself, forming GAM6051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6051 precursor RNA, designated SEQ ID NO: 5706, and a schematic representation of a predicted secondary folding of GAM6051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6051 folded precursor RNA yielding a GAM6051 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6051 RNA, hereby incorporated herein.

GAM6051 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6051 target RNA, herein designated GAM TARGET RNA. GAM6051 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6051 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6051 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6051 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6051 RNA, herein designated GAM RNA, to target binding sites on GAM6051 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6051 target RNA into GAM6051 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6051 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6051 target genes. The mRNA of each one of this plurality of GAM6051 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6051 RNA, herein designated GAM RNA, and which when bound by GAM6051 RNA causes inhibition of translation of the GAM6051 target mRNA into a corresponding GAM6051 target protein.

The mechanism of the translational inhibition exerted by GAM6051 RNA, herein designated GAM RNA, on one or more GAM6051 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6051 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6051 RNA, herein designated GAM RNA, of GAM6051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6051 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6051 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6051 RNA correlate with, and may be deduced from, the identity of the GAM6051 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6055 6917 GTGGGTGGTG CAGGGGTGGT CTTAGGAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 6055 (GAM6055) oligonucleotides modulates expression of respective target genes

CTTTCCTGAA whose function and utility is known in the art.

GGAGTGGCCA GAM6055 is a novel bioinformatically detectable regulatory, non protein coding, GGGTTCACCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6055 was detected is

ATCTTTCCAC described with additional reference to Figs. 9-15.

CCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6055 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6055

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6055

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6055 precursor RNA is designated SEQ ID:6917, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6917 is located from position 43546131 to position 43546204 relative to chromosome 19 on the `+` strand.

GAM6055 precursor RNA folds onto itself, forming GAM6055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6055 precursor RNA, designated SEQ ID NO: 6917, and a schematic representation of a predicted secondary folding of GAM6055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6055 folded precursor RNA yielding a GAM6055 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6055 RNA, hereby incorporated herein.

GAM6055 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6055 target RNA, herein designated GAM TARGET RNA. GAM6055 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6055 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6055 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6055 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6055 RNA, herein designated GAM RNA, to target binding sites on GAM6055 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6055 target RNA into GAM6055 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6055 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6055 target genes. The mRNA of each one of this plurality of GAM6055 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6055 RNA, herein designated GAM RNA, and which when bound by GAM6055 RNA causes inhibition of translation of the GAM6055 target mRNA into a corresponding GAM6055 target protein.

The mechanism of the translational inhibition exerted by GAM6055 RNA, herein designated GAM RNA, on one or more GAM6055 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6055 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6055 RNA, herein designated GAM RNA, of GAM6055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6055 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6055 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6055 RNA correlate with, and may be deduced from, the identity of the GAM6055 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6083 5994 CACCCCGTTC Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGTAACACG detected oligonucleotides of the present invention, referred to here as Genomic Address
GGCCTGAGGT Messenger 6083 (GAM6083) oligonucleotides modulates expression of respective target genes
CAGCAGTAGA whose function and utility is known in the art.

GGACCAGTAT GAM6083 is a novel bioinformatically detectable regulatory, non protein coding,
TGGTTTTGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6083 was detected is

CCCAGCCTCT described with additional reference to Figs. 9-15.

GCGTGGATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTG encoded by the human genome.

GAM6083 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6083

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6083
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6083 precursor RNA is designated SEQ ID:5994, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5994 is located from position 69517032 to position 69517115 relative to chromosome 11 on the `-` strand.

GAM6083 precursor RNA folds onto itself, forming GAM6083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6083 precursor RNA, designated SEQ ID NO: 5994, and a schematic representation of a predicted secondary folding of GAM6083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6083 folded precursor RNA yielding a GAM6083 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6083 RNA, hereby incorporated herein.

GAM6083 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6083 target RNA, herein designated GAM TARGET RNA. GAM6083 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6083 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6083 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6083 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6083 RNA, herein designated GAM RNA, to target binding sites on GAM6083 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6083 target RNA into GAM6083 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6083 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6083 target genes. The mRNA of each one of this plurality of GAM6083 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6083 RNA, herein designated GAM RNA, and which when bound by GAM6083 RNA causes inhibition of translation of the GAM6083 target mRNA into a corresponding GAM6083 target protein.

The mechanism of the translational inhibition exerted by GAM6083 RNA, herein designated GAM RNA, on one or more GAM6083 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6083 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6083 RNA, herein designated GAM RNA, of GAM6083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6083 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6083 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6083 RNA correlate with, and may be deduced from, the identity of the GAM6083 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6102 7225 TGGCCATGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACTGTAAT Messenger 6102 (GAM6102) oligonucleotides modulates expression of respective target genes
CTCAGCACTT whose function and utility is known in the art.

TCGGAAGCCA GAM6102 is a novel bioinformatically detectable regulatory, non protein coding,
AGGCGGTCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6102 was detected is

ATCACCTGAG described with additional reference to Figs. 9-15.

GTCAGGAGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGAGACCAGT encoded by the human genome.

CTGGCCA GAM6102 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6102
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6102
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6102 precursor RNA is designated SEQ ID:7225, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7225 is located from position 43773501 to position 43773597 relative to chromosome 7 on the `+` strand.

GAM6102 precursor RNA folds onto itself, forming GAM6102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6102 precursor RNA, designated SEQ ID NO: 7225, and a schematic representation of a predicted secondary folding of GAM6102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6102 folded precursor RNA yielding a GAM6102 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6102 RNA, hereby incorporated herein.

GAM6102 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6102 target RNA, herein designated GAM TARGET RNA. GAM6102 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6102 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6102 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6102 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6102 RNA, herein designated GAM RNA, to target binding sites on GAM6102 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6102 target RNA into GAM6102 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6102 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6102 target genes. The mRNA of each one of this plurality of GAM6102 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6102 RNA, herein designated GAM RNA, and which when bound by GAM6102 RNA causes inhibition of translation of the GAM6102 target mRNA into a corresponding GAM6102 target protein.

The mechanism of the translational inhibition exerted by GAM6102 RNA, herein designated GAM RNA, on one or more GAM6102 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6102 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6102 RNA, herein designated GAM RNA, of GAM6102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM6102 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6102 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6102 RNA correlate with, and may be deduced from, the identity of the GAM6102 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6121 6203 CTGAGGCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAAATTGCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGAACCCAGG Messenger 6121 (GAM6121) oligonucleotides modulates expression of respective target genes
AGGTAGAGGT whose function and utility is known in the art.

TGCAGTGAGT GAM6121 is a novel bioinformatically detectable regulatory, non protein coding,
CAAGATCATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6121 was detected is

CCATTGCACT described with additional reference to Figs. 9-15.

CCAACCTGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGACAAGAGC encoded by the human genome.

AAAACTCTGT GAM6121 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6121
CTCAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6121

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6121 precursor RNA is designated SEQ ID:6203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6203 is located from position 182463 to position 182567 relative to chromosome 18 on the `+` strand.

GAM6121 precursor RNA folds onto itself, forming GAM6121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6121 precursor RNA, designated SEQ ID NO: 6203, and a schematic representation of a predicted secondary folding of GAM6121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6121 folded precursor RNA yielding a GAM6121 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6121 RNA, hereby incorporated herein.

GAM6121 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6121 target RNA, herein designated GAM TARGET RNA. GAM6121 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6121 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6121 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6121 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6121 RNA, herein designated GAM RNA, to target binding sites on GAM6121 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6121 target RNA into GAM6121 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6121 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6121 target genes. The mRNA of each one of this plurality of GAM6121 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6121 RNA, herein designated GAM RNA, and which when bound by GAM6121 RNA causes inhibition of translation of the GAM6121 target mRNA into a corresponding GAM6121 target protein.

The mechanism of the translational inhibition exerted by GAM6121 RNA, herein designated GAM RNA, on one or more GAM6121 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6121 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6121 RNA, herein designated GAM RNA, of

GAM6121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6121 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6121 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6121 RNA correlate with, and may be deduced from, the identity of the GAM6121 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6161 7237 TGGGCTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAAGCATGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCACACCAGG Messenger 6161 (GAM6161) oligonucleotides modulates expression of respective target genes

TGCCCAGACA whose function and utility is known in the art.

TCTGGTTGGC GAM6161 is a novel bioinformatically detectable regulatory, non protein coding,

TTTGGCTGAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6161 was detected is

TTGTCCTGCA described with additional reference to Figs. 9-15.

GGCACCTGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGTCTGGAT encoded by the human genome.

TTGCACACTT GAM6161 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6161

TCCAAGTTGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6161

CCA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6161 precursor RNA is designated SEQ ID:7237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7237 is located from position 28205840 to position 28205952 relative to chromosome 15 on the `-` strand.

GAM6161 precursor RNA folds onto itself, forming GAM6161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6161 precursor RNA, designated SEQ ID NO: 7237, and a schematic representation of a predicted secondary folding of GAM6161 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6161 folded precursor RNA yielding a GAM6161 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6161 RNA, hereby incorporated herein.

GAM6161 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6161 target RNA, herein designated GAM TARGET RNA. GAM6161 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6161 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6161 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6161 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6161 RNA, herein designated GAM RNA, to target binding sites on GAM6161 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6161 target RNA into GAM6161 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6161 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6161 target genes. The mRNA of each one of this plurality of GAM6161 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6161 RNA, herein designated GAM RNA, and which when bound by GAM6161 RNA causes inhibition of translation of the GAM6161 target mRNA into a corresponding GAM6161 target protein.

The mechanism of the translational inhibition exerted by GAM6161 RNA, herein designated GAM RNA, on one or more GAM6161 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6161 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM6161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6161 RNA, herein designated GAM RNA, of GAM6161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6161 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6161 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6161 RNA correlate with, and may be deduced from, the identity of the GAM6161 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6172 7032 TCCCTGACCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CACCTTTACT detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGAAGTCTA Messenger 6172 (GAM6172) oligonucleotides modulates expression of respective target genes

AGGAACAGAC whose function and utility is known in the art.

TGTTTAACCT GAM6172 is a novel bioinformatically detectable regulatory, non protein coding,

GTTTCCAGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6172 was detected is

GTTTCAGGGA described with additional reference to Figs. 9-15.

CTTCTGTATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGTGTAGCA encoded by the human genome.

AGGA GAM6172 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6172

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6172

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6172 precursor RNA is designated SEQ ID:7032, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7032 is located from position 73791102 to position 73791195 relative to chromosome 13 on the `-` strand.

GAM6172 precursor RNA folds onto itself, forming GAM6172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6172 precursor RNA, designated SEQ ID NO: 7032, and a schematic representation of a predicted secondary folding of GAM6172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6172 folded precursor RNA yielding a GAM6172 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6172 RNA, hereby incorporated herein.

GAM6172 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6172 target RNA, herein designated GAM TARGET RNA. GAM6172 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6172 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6172 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6172 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6172 RNA, herein designated GAM RNA, to target binding sites on GAM6172 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6172 target RNA into GAM6172 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6172 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6172 target genes. The mRNA of each one of this plurality of GAM6172 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6172 RNA, herein designated GAM RNA, and which when bound by GAM6172 RNA causes inhibition of translation of the GAM6172 target mRNA into a corresponding GAM6172 target protein.

The mechanism of the translational inhibition exerted by GAM6172 RNA, herein designated GAM RNA, on one or more GAM6172 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6172 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6172 RNA, herein designated GAM RNA, of GAM6172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6172 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6172 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6172 RNA correlate with, and may be deduced from, the identity of the GAM6172 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6234 7305 TTCTGAACTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGCCAGATC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTAACCTGCT Messenger 6234 (GAM6234) oligonucleotides modulates expression of respective target genes

GGTAAAGCAC whose function and utility is known in the art.

TGGCTGAGGG GAM6234 is a novel bioinformatically detectable regulatory, non protein coding,

TTTAGACTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6234 was detected is

CAAGGAATTT described with additional reference to Figs. 9-15.

GAGGTTGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCCTGCCTT encoded by the human genome.

ATTGCAACCC GAM6234 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6234

AGTGTCTGGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6234

TGCTGAGACC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

AGAG to the nucleotide sequence of GAM6234 precursor RNA is designated SEQ ID:7305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7305 is located from position 80342962 to position 80343085 relative to chromosome 10

on the `+` strand.

GAM6234 precursor RNA folds onto itself, forming GAM6234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6234 precursor RNA, designated SEQ ID NO: 7305, and a schematic representation of a predicted secondary folding of GAM6234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6234 folded precursor RNA yielding a GAM6234 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6234 RNA, hereby incorporated herein.

GAM6234 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6234 target RNA, herein designated GAM TARGET RNA. GAM6234 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6234 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6234 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6234 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6234 RNA, herein designated GAM RNA, to target binding sites on GAM6234 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6234 target RNA into GAM6234 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6234 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6234 target genes. The mRNA of each one of this plurality of GAM6234 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM6234 RNA, herein designated GAM RNA, and which when bound by GAM6234 RNA causes inhibition of translation of the GAM6234 target mRNA into a corresponding GAM6234 target protein.

The mechanism of the translational inhibition exerted by GAM6234 RNA, herein designated GAM RNA, on one or more GAM6234 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6234 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6234 RNA, herein designated GAM RNA, of GAM6234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6234 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6234 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6234 RNA correlate with, and may be deduced from, the identity of the GAM6234 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGACATATTT whose function and utility is known in the art.

TGGTTGGCAC GAM6265 is a novel bioinformatically detectable regulatory, non protein coding,

CACATTCTTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6265 was detected is

GTATAGTGGG described with additional reference to Figs. 9-15.

TTAGTGGTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AATAGTTTGC encoded by the human genome.

AGACTTTGTG GAM6265 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6265 AAACAAAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6265 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6265 precursor RNA is designated SEQ ID:7349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7349 is located from position 78004551 to position 78004658 relative to chromosome 9 on the `+` strand.

GAM6265 precursor RNA folds onto itself, forming GAM6265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6265 precursor RNA, designated SEQ ID NO: 7349, and a schematic representation of a predicted secondary folding of GAM6265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6265 folded precursor RNA yielding a GAM6265 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6265 RNA, hereby incorporated herein.

GAM6265 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6265 target RNA, herein designated GAM TARGET RNA. GAM6265 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6265 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6265 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6265 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6265 RNA, herein designated GAM RNA, to target binding sites on GAM6265 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6265 target RNA into GAM6265 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6265 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6265 target genes. The mRNA of each one of this plurality of GAM6265 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6265 RNA, herein designated GAM RNA, and which when bound by GAM6265 RNA causes inhibition of translation of the GAM6265 target mRNA into a corresponding GAM6265 target protein.

The mechanism of the translational inhibition exerted by GAM6265 RNA, herein designated GAM RNA, on one or more GAM6265 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6265 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6265 RNA, herein designated GAM RNA, of GAM6265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6265 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6265 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6265 RNA correlate with, and may be deduced from, the identity of the GAM6265 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6271 6477 GATTCAAAGC AAGATGGTAG CATTGGAGAG GATGAGATAT GGTCAGATGA GGATATATTT Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 6271 (GAM6271) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM6271 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM6271 was detected is

TAAAAGTTGA described with additional reference to Figs. 9-15.

GCTAACAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTGCTGAGG encoded by the human genome.

AATC GAM6271 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6271 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6271 precursor RNA is designated SEQ ID:6477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6477 is located from position 133099410 to position 133099503 relative to chromosome 7 on the `+` strand.

GAM6271 precursor RNA folds onto itself, forming GAM6271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6271 precursor RNA, designated SEQ ID NO: 6477, and a schematic representation of a predicted secondary folding of GAM6271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6271 folded precursor RNA yielding a GAM6271 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6271 RNA, hereby incorporated herein.

GAM6271 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6271 target RNA, herein designated GAM TARGET RNA. GAM6271 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6271 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6271 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6271 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6271 RNA, herein designated GAM RNA, to target binding sites on GAM6271 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6271 target RNA into GAM6271 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6271 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6271 target genes. The mRNA of each one of this plurality of GAM6271 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6271 RNA, herein designated GAM RNA, and which when bound by GAM6271 RNA causes inhibition of translation of the GAM6271 target mRNA into a corresponding GAM6271 target protein.

The mechanism of the translational inhibition exerted by GAM6271 RNA, herein designated GAM RNA, on one or more GAM6271 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6271 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6271 RNA, herein designated GAM RNA, of GAM6271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6271 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6271 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6271 RNA correlate with, and may be deduced from, the identity of the GAM6271 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6296 7034 TCCCTTCAGA GCCCATGGGT TTCCCATTCC Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 6296 (GAM6296) oligonucleotides modulates expression of respective target genes

CTCCTGTCAG whose function and utility is known in the art.

CCCTGGCCAT GAM6296 is a novel bioinformatically detectable regulatory, non protein coding, GAAATCCTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6296 was detected is

GGATCTGGAG described with additional reference to Figs. 9-15.

GGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6296 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6296

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6296

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6296 precursor RNA is designated SEQ ID:7034, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7034 is located from position 40099114 to position 40099186 relative to chromosome 17 on the `-` strand.

GAM6296 precursor RNA folds onto itself, forming GAM6296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6296 precursor RNA, designated SEQ ID NO: 7034, and a schematic representation of a predicted secondary folding of GAM6296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6296 folded precursor RNA yielding a GAM6296 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM6296 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6296 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM6296 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6296 target RNA, herein designated GAM TARGET RNA. GAM6296 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6296 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM6296 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6296 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6296 RNA, herein designated GAM RNA, to target binding sites on GAM6296 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6296 target RNA into GAM6296 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6296 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6296 target genes. The mRNA of each one of this plurality of GAM6296 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6296 RNA, herein designated GAM RNA, and which when bound by GAM6296 RNA causes inhibition of translation of the GAM6296 target mRNA into a corresponding GAM6296 target protein.

The mechanism of the translational inhibition exerted by GAM6296 RNA, herein designated GAM RNA, on one or more GAM6296 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6296 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6296 RNA, herein designated GAM RNA, of GAM6296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6296 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6296 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6296 RNA correlate with, and may be deduced from, the identity of the GAM6296 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6306 7263 TGTCCCTTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGCTGTGTT detected oligonucleotides of the present invention, referred to here as Genomic Address

AACTGTTCAA Messenger 6306 (GAM6306) oligonucleotides modulates expression of respective target genes

ACTCAGGCCT whose function and utility is known in the art.

GTGTGACTCC GAM6306 is a novel bioinformatically detectable regulatory, non protein coding,

ATTGGGGTGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6306 was detected is

GAGGTGAAAG described with additional reference to Figs. 9-15.

CATAACATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTACAGAGGG encoded by the human genome.

GACA GAM6306 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6306 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6306 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6306 precursor RNA is designated SEQ ID:7263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7263 is located from position 56453736 to position 56453829 relative to chromosome 12 on the `-` strand.

GAM6306 precursor RNA folds onto itself, forming GAM6306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6306 precursor RNA, designated SEQ ID NO: 7263, and a schematic representation of a predicted secondary folding of GAM6306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6306 folded precursor RNA yielding a GAM6306 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6306 RNA, hereby incorporated herein.

GAM6306 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6306 target RNA, herein designated GAM TARGET RNA. GAM6306 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6306 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6306 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6306 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6306 RNA, herein designated GAM RNA, to target binding sites on GAM6306 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6306 target RNA into GAM6306 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6306 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6306 target genes. The mRNA of each one of this plurality of GAM6306 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6306 RNA, herein designated GAM RNA, and which when bound by GAM6306 RNA causes inhibition of translation of the GAM6306 target mRNA into a corresponding GAM6306 target protein.

The mechanism of the translational inhibition exerted by GAM6306 RNA, herein designated GAM RNA, on one or more GAM6306 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6306 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6306 RNA, herein designated GAM RNA, of GAM6306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6306 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6306 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6306 RNA correlate with, and may be deduced from, the identity of the GAM6306 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGGCCAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGCCGGGCC Messenger 6361 (GAM6361) oligonucleotides modulates expression of respective target genes

TGGGGCCTGG whose function and utility is known in the art.

TGTCCGACCG GAM6361 is a novel bioinformatically detectable regulatory, non protein coding,

CAGCCCAGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6361 was detected is

CCCCTCATCG described with additional reference to Figs. 9-15.

CCTGACACTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCCTCTGC encoded by the human genome.

GAM6361 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6361

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6361

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6361 precursor RNA is designated SEQ ID:6488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6488 is located from position 77134484 to position 77134572 relative to chromosome 17 on the `-` strand.

GAM6361 precursor RNA folds onto itself, forming GAM6361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6361 precursor RNA, designated SEQ ID NO: 6488, and a schematic representation of a predicted secondary folding of GAM6361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6361 folded precursor RNA

yielding a GAM6361 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6361 RNA, hereby incorporated herein.

GAM6361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6361 target RNA, herein designated GAM TARGET RNA. GAM6361 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6361 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6361 RNA, herein designated GAM RNA, to target binding sites on GAM6361 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6361 target RNA into GAM6361 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6361 target genes. The mRNA of each one of this plurality of GAM6361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6361 RNA, herein designated GAM RNA, and which when bound by GAM6361 RNA causes inhibition of translation of the GAM6361 target mRNA into a corresponding GAM6361 target protein.

The mechanism of the translational inhibition exerted by GAM6361 RNA, herein designated GAM RNA, on one or more GAM6361 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6361 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6361 RNA, herein designated GAM RNA, of GAM6361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6361 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6361 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6361 RNA correlate with, and may be deduced from, the identity of the GAM6361 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6366 5733 AGAGTATACC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGCCCGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCTGTAGCT Messenger 6366 (GAM6366) oligonucleotides modulates expression of respective target genes

CATGCCTGTA whose function and utility is known in the art.

ATCCCACCAC GAM6366 is a novel bioinformatically detectable regulatory, non protein coding,

TTTGGGAGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6366 was detected is

CAAGGCGGGT described with additional reference to Figs. 9-15.

GGATCATTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGGTTAGTAG encoded by the human genome.

TTTGAGACCA GAM6366 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6366

GCTTGGCCAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6366

CATGGGGAAA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

CTCT to the nucleotide sequence of GAM6366 precursor RNA is designated SEQ ID:5733, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5733 is located from position 102138768 to position 102138891 relative to chromosome 14 on the `+` strand.

GAM6366 precursor RNA folds onto itself, forming GAM6366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6366 precursor RNA, designated SEQ ID NO: 5733, and a schematic representation of a predicted secondary folding of GAM6366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6366 folded precursor RNA yielding a GAM6366 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6366 RNA, hereby incorporated herein.

GAM6366 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6366 target RNA, herein designated GAM TARGET RNA. GAM6366 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6366 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6366 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6366 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6366 RNA, herein designated GAM RNA, to target binding sites on GAM6366 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6366 target RNA into GAM6366 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6366 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6366 target genes. The mRNA of each one of this plurality of GAM6366 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6366 RNA, herein designated GAM RNA, and which when bound by GAM6366 RNA causes inhibition of translation of the GAM6366 target mRNA into a corresponding GAM6366 target protein.

The mechanism of the translational inhibition exerted by GAM6366 RNA, herein designated GAM RNA, on one or more GAM6366 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6366 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6366 RNA, herein designated GAM RNA, of GAM6366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6366 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6366 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6366 RNA correlate with, and may be deduced from, the identity of the GAM6366 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6388 6256 CTTCTTGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCAGTGTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TCCTGATTGC Messenger 6388 (GAM6388) oligonucleotides modulates expression of respective target genes

CCCAGTCTAG whose function and utility is known in the art.

TTTATCGCAA GAM6388 is a novel bioinformatically detectable regulatory, non protein coding,

GGGAATTTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6388 was detected is

TTGCGGGGCA described with additional reference to Figs. 9-15.

GTGAGCTCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTTGGCAGA encoded by the human genome.

AG GAM6388 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6388

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6388

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6388 precursor RNA is designated SEQ ID:6256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6256 is located from position 9805117 to position 9805208 relative to chromosome 8 on the `+` strand.

GAM6388 precursor RNA folds onto itself, forming GAM6388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6388 precursor RNA, designated SEQ ID NO: 6256, and a schematic representation of a predicted secondary folding of GAM6388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6388 folded precursor RNA yielding a GAM6388 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6388 RNA, hereby incorporated herein.

GAM6388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6388 target RNA, herein designated GAM TARGET RNA. GAM6388 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6388 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6388 RNA, herein designated GAM RNA, to target binding sites on GAM6388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6388 target RNA into GAM6388 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6388 target genes. The mRNA of each one of this plurality of GAM6388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6388 RNA, herein designated GAM RNA, and which when bound by GAM6388 RNA causes inhibition of translation of the GAM6388 target mRNA into a corresponding GAM6388 target protein.

The mechanism of the translational inhibition exerted by GAM6388 RNA, herein designated GAM RNA, on one or more GAM6388 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6388 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6388 RNA, herein designated GAM RNA, of GAM6388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6388 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6388 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6388 RNA correlate with, and may be deduced from, the identity of the GAM6388 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCTGGCATT whose function and utility is known in the art.

TATAGAATCT GAM6417 is a novel bioinformatically detectable regulatory, non protein coding,
GGCTTTCTTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6417 was detected is

TATTGGGTGG described with additional reference to Figs. 9-15.

AAAGCTAGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAAACCAGTT encoded by the human genome.

TCTCTCAGCC GAM6417 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6417

TTTTCTCTCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6417

TCAGGTCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6417 precursor RNA is designated SEQ ID:6575, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6575 is located from position 116757828 to position 116757945 relative to chromosome 9 on the `-` strand.

GAM6417 precursor RNA folds onto itself, forming GAM6417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6417 precursor RNA, designated SEQ ID NO: 6575, and a schematic representation of a predicted secondary folding of GAM6417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6417 folded precursor RNA yielding a GAM6417 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6417 RNA, hereby incorporated herein.

GAM6417 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6417 target RNA, herein designated GAM TARGET RNA. GAM6417 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6417 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6417 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6417 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6417 RNA, herein designated GAM RNA, to target binding sites on GAM6417 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6417 target RNA

into GAM6417 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6417 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6417 target genes. The mRNA of each one of this plurality of GAM6417 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6417 RNA, herein designated GAM RNA, and which when bound by GAM6417 RNA causes inhibition of translation of the GAM6417 target mRNA into a corresponding GAM6417 target protein.

The mechanism of the translational inhibition exerted by GAM6417 RNA, herein designated GAM RNA, on one or more GAM6417 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6417 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6417 RNA, herein designated GAM RNA, of GAM6417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6417 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6417 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6417 RNA correlate with, and may be deduced from, the identity of the GAM6417 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6431 6755 GGCGTCACTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCTGATGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

CGGTTGGGAA Messenger 6431 (GAM6431) oligonucleotides modulates expression of respective target genes

GGCAAAACCT whose function and utility is known in the art.

GCCCTGAAAA GAM6431 is a novel bioinformatically detectable regulatory, non protein coding,

GCCTTTGGGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6431 was detected is

AGTGATTCTA described with additional reference to Figs. 9-15.

GCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6431 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6431 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6431 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6431 precursor RNA is designated SEQ ID:6755, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6755 is located from position 12904884 to position 12904956 relative to chromosome 19 on the `+` strand.

GAM6431 precursor RNA folds onto itself, forming GAM6431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6431 precursor RNA, designated SEQ ID NO: 6755, and a schematic representation of a predicted secondary folding of GAM6431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6431 folded precursor RNA yielding a GAM6431 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6431 RNA, hereby incorporated herein.

GAM6431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6431 target RNA, herein designated GAM TARGET RNA. GAM6431 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6431 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6431 RNA, herein designated GAM RNA, to target binding sites on GAM6431 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6431 target RNA into GAM6431 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6431 target genes. The mRNA of each one of this plurality of GAM6431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6431 RNA, herein designated GAM RNA, and which when bound by GAM6431 RNA causes inhibition of translation of the GAM6431 target mRNA into a corresponding GAM6431 target protein.

The mechanism of the translational inhibition exerted by GAM6431 RNA, herein designated GAM RNA, on one or more GAM6431 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6431 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6431 RNA, herein designated GAM RNA, of GAM6431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6431 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6431 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6431 RNA correlate with, and may be deduced from, the identity of the GAM6431 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6440 7026 TCCCCTAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGATTATCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TATCAGCTAC Messenger 6440 (GAM6440) oligonucleotides modulates expression of respective target genes

TGACCCAGTT whose function and utility is known in the art.

AGCTTTCCTA GAM6440 is a novel bioinformatically detectable regulatory, non protein coding,

CTTCACAACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6440 was detected is

GGTTTCTAAT described with additional reference to Figs. 9-15.

GCTTTATGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTGTGAGAG encoded by the human genome.

AAATGGCAAG GAM6440 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6440

TTGGGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6440

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6440 precursor RNA is designated SEQ ID:7026, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7026 is located from position 104082529 to position 104082634 relative to chromosome 7 on the `+` strand.

GAM6440 precursor RNA folds onto itself, forming GAM6440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6440 precursor RNA, designated SEQ ID NO: 7026, and a schematic representation of a predicted secondary folding of GAM6440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6440 folded precursor RNA yielding a GAM6440 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6440 RNA, hereby incorporated herein.

GAM6440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6440 target RNA, herein designated GAM TARGET RNA. GAM6440 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6440 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6440 RNA, herein designated GAM RNA, to target binding sites on GAM6440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6440 target RNA into GAM6440 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6440 target genes. The mRNA of each one of this plurality of GAM6440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6440 RNA, herein designated GAM RNA, and which when bound by GAM6440 RNA causes inhibition of translation of the GAM6440 target mRNA into a corresponding GAM6440 target protein.

The mechanism of the translational inhibition exerted by GAM6440 RNA, herein designated GAM RNA, on one or more GAM6440 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6440 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6440 RNA, herein designated GAM RNA, of GAM6440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6440 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6440 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6440 RNA correlate with, and may be deduced from, the identity of the GAM6440 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6459 5667 AAGCTGGGGG CACTGGCTTC TGCTCTTGCT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 6459 (GAM6459) oligonucleotides modulates expression of respective target genes

CTTTCTTCTG whose function and utility is known in the art.

GAAACATTAT GAM6459 is a novel bioinformatically detectable regulatory, non protein coding,
TCTGTTCCTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6459 was detected is

TGGACATGGG described with additional reference to Figs. 9-15.

CAAGGGTCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTCCCTAACT encoded by the human genome.

T GAM6459 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6459
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6459
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6459 precursor RNA is designated SEQ ID:5667, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5667 is located from position 30850314 to position 30850404 relative to chromosome 6 on the `+` strand.

GAM6459 precursor RNA folds onto itself, forming GAM6459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6459 precursor RNA, designated SEQ ID NO: 5667, and a schematic representation of a predicted secondary folding of GAM6459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6459 folded precursor RNA yielding a GAM6459 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM6459 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6459 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM6459 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6459 target RNA, herein designated GAM TARGET RNA. GAM6459 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6459 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM6459 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6459 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6459 RNA, herein designated GAM RNA, to target binding sites on GAM6459 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6459 target RNA into GAM6459 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6459 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6459 target genes. The mRNA of each one of this plurality of GAM6459 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6459 RNA, herein designated GAM RNA, and which when bound by GAM6459 RNA causes inhibition of translation of the GAM6459 target mRNA into a corresponding GAM6459 target protein.

The mechanism of the translational inhibition exerted by GAM6459 RNA, herein designated GAM RNA, on one or more GAM6459 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6459 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6459 RNA, herein designated GAM RNA, of GAM6459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6459 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6459 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6459 RNA correlate with, and may be deduced from, the identity of the GAM6459 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6466 5788 AGGGCAAGAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTCGCTCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCGTGGCCC Messenger 6466 (GAM6466) oligonucleotides modulates expression of respective target genes

GTGTTCTCTC whose function and utility is known in the art.

CTTTTGTCCC GAM6466 is a novel bioinformatically detectable regulatory, non protein coding,

CATAGTGTGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6466 was detected is

CTCCGCCAGG described with additional reference to Figs. 9-15.

AACTTGGAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCTGAAGAC encoded by the human genome.

TGTGAATGAG GAM6466 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6466

AGTCATGGGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6466

CTGTGGAACG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

CTCATCCCT to the nucleotide sequence of GAM6466 precursor RNA is designated SEQ ID:5788, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5788 is located from position 78873540 to position 78873668 relative to chromosome 17 on the `+` strand.

GAM6466 precursor RNA folds onto itself, forming GAM6466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6466 precursor RNA, designated SEQ ID NO: 5788, and a schematic representation of a predicted secondary folding of GAM6466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6466 folded precursor RNA yielding a GAM6466 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6466 RNA, hereby incorporated herein.

GAM6466 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM6466 target RNA, herein designated GAM TARGET RNA. GAM6466 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6466 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6466 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6466 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6466 RNA, herein designated GAM RNA, to target binding sites on GAM6466 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6466 target RNA into GAM6466 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6466 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6466 target genes. The mRNA of each one of this plurality of GAM6466 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6466 RNA, herein designated GAM RNA, and which when bound by GAM6466 RNA causes inhibition of translation of the GAM6466 target mRNA into a corresponding GAM6466 target protein.

The mechanism of the translational inhibition exerted by GAM6466 RNA, herein designated GAM RNA, on one or more GAM6466 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6466 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6466 RNA, herein designated GAM RNA, of GAM6466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6466 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM6466 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6466 RNA correlate with, and may be deduced from, the identity of the GAM6466 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6467 6179 CTCTGTGATG Fig. 8 further provides a conceptual description of another novel bioinformatically
CTTGGGGACC detected oligonucleotides of the present invention, referred to here as Genomic Address
GGCTCCTCGG Messenger 6467 (GAM6467) oligonucleotides modulates expression of respective target genes
TCACACCCCA whose function and utility is known in the art.

GTCCTGCTCT GAM6467 is a novel bioinformatically detectable regulatory, non protein coding,
GAAGGTTGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6467 was detected is

GTTTTCCAAA described with additional reference to Figs. 9-15.

CAGAAGGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTAGCTAGAG encoded by the human genome.

GGGAGATAGC GAM6467 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6467
AAGATTCTGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6467
AGTCTGGAAA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
GCCTTCACTT to the nucleotide sequence of GAM6467 precursor RNA is designated SEQ ID:6179, and is

G provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6179 is located from position 23774919 to position 23775049 relative to chromosome 13 on the `+` strand.

GAM6467 precursor RNA folds onto itself, forming GAM6467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6467 precursor RNA, designated SEQ ID NO: 6179, and a schematic representation of a predicted secondary folding of GAM6467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6467 folded precursor RNA yielding a GAM6467 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor

product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6467 RNA, hereby incorporated herein.

GAM6467 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6467 target RNA, herein designated GAM TARGET RNA. GAM6467 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6467 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6467 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6467 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6467 RNA, herein designated GAM RNA, to target binding sites on GAM6467 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6467 target RNA into GAM6467 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6467 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6467 target genes. The mRNA of each one of this plurality of GAM6467 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6467 RNA, herein designated GAM RNA, and which when bound by GAM6467 RNA causes inhibition of translation of the GAM6467 target mRNA into a corresponding GAM6467 target protein.

The mechanism of the translational inhibition exerted by GAM6467 RNA, herein designated GAM RNA, on one or more GAM6467 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6467 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6467 RNA, herein designated GAM RNA, of GAM6467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6467 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6467 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6467 RNA correlate with, and may be deduced from, the identity of the GAM6467 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6506 6866 GTAGTCCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
CTATTCAGGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTTGAGGTG Messenger 6506 (GAM6506) oligonucleotides modulates expression of respective target genes
GGAGGATCAC whose function and utility is known in the art.

TTCGGCCCAG GAM6506 is a novel bioinformatically detectable regulatory, non protein coding,
GAGTCTGAGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6506 was detected is

CTGGAGTGAG described with additional reference to Figs. 9-15.

CTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM6506 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6506

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6506
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6506 precursor RNA is designated SEQ ID:6866, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6866 is located from position 29270291 to position 29270364 relative to chromosome 17 on the `+` strand.

GAM6506 precursor RNA folds onto itself, forming GAM6506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6506 precursor RNA, designated SEQ ID NO: 6866, and a schematic representation of a predicted secondary folding of GAM6506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6506 folded precursor RNA yielding a GAM6506 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM6506 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6506 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM6506 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6506 target RNA, herein designated GAM TARGET RNA. GAM6506 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6506 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6506 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6506 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6506 RNA, herein designated GAM RNA, to target binding sites on GAM6506 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6506 target RNA into GAM6506 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6506 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6506 target genes. The mRNA of each one of this plurality of GAM6506 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6506 RNA, herein designated GAM RNA, and which when bound by GAM6506 RNA causes inhibition of translation of the GAM6506 target mRNA into a corresponding GAM6506 target protein.

The mechanism of the translational inhibition exerted by GAM6506 RNA, herein designated GAM RNA, on one or more GAM6506 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6506 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6506 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6506 RNA, herein designated GAM RNA, of GAM6506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in
Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6506 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6506 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6506 RNA correlate with, and may be deduced from, the identity of the GAM6506 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGAAGCTGAG GAM6509 is a novel bioinformatically detectable regulatory, non protein coding,
GGGAGAACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6509 was detected is

TCTGTTCTTC described with additional reference to Figs. 9-15.

CCCACCTTCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTTGCATTC encoded by the human genome.

CTCCTTCAGC GAM6509 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6509
ATCTTCTTAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6509
GG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6509 precursor RNA is designated SEQ ID:6106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6106 is located from position 16592351 to position 16592462 relative to chromosome 21 on the `+` strand.

GAM6509 precursor RNA folds onto itself, forming GAM6509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6509 precursor RNA, designated SEQ ID NO: 6106, and a schematic representation of a predicted secondary folding of GAM6509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6509 folded precursor RNA yielding a GAM6509 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM6509 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6509 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM6509 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6509 target RNA, herein designated GAM TARGET RNA. GAM6509 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6509 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6509 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6509 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6509 RNA, herein designated GAM RNA, to target binding sites on GAM6509 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6509 target RNA into GAM6509 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6509 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6509 target genes. The mRNA of each one of this plurality of GAM6509 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6509 RNA, herein designated GAM RNA, and which when bound by GAM6509 RNA causes inhibition of translation of the GAM6509 target mRNA into a corresponding GAM6509 target protein.

The mechanism of the translational inhibition exerted by GAM6509 RNA, herein designated GAM RNA, on one or more GAM6509 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6509 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6509 RNA, herein designated GAM RNA, of GAM6509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6509 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6509 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6509 RNA correlate with, and may be deduced from, the identity of the GAM6509 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6531 7064 TCTCCCAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
AATATTCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GATAGGCTGC Messenger 6531 (GAM6531) oligonucleotides modulates expression of respective target genes
CAGTTGGACT whose function and utility is known in the art.

AAGGAAGCCA GAM6531 is a novel bioinformatically detectable regulatory, non protein coding,
CTCCTGCGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6531 was detected is

ACCCTGGGAG described with additional reference to Figs. 9-15.

A GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM6531 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6531

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6531
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6531 precursor RNA is designated SEQ ID:7064, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7064 is located from position 54026269 to position 54026339 relative to chromosome 8 on the `+` strand.

GAM6531 precursor RNA folds onto itself, forming GAM6531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6531 precursor RNA, designated SEQ ID NO: 7064, and a schematic representation of a predicted secondary folding of GAM6531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6531 folded precursor RNA yielding a GAM6531 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6531 RNA, hereby incorporated herein.

GAM6531 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6531 target RNA, herein designated GAM TARGET RNA. GAM6531 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6531 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6531 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6531 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6531 RNA, herein designated GAM RNA, to target binding sites on GAM6531 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6531 target RNA into GAM6531 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6531 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6531 target genes. The mRNA of each one of this plurality of GAM6531 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6531 RNA, herein

designated GAM RNA, and which when bound by GAM6531 RNA causes inhibition of translation of the GAM6531 target mRNA into a corresponding GAM6531 target protein.

The mechanism of the translational inhibition exerted by GAM6531 RNA, herein designated GAM RNA, on one or more GAM6531 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6531 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6531 RNA, herein designated GAM RNA, of GAM6531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6531 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6531 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6531 RNA correlate with, and may be deduced from, the identity of the GAM6531 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6541 6067 CCCAAGGTTA Fig. 8 further provides a conceptual description of another novel bioinformatically
CTTGGTAAGT detected oligonucleotides of the present invention, referred to here as Genomic Address
AAAGAGAGAA Messenger 6541 (GAM6541) oligonucleotides modulates expression of respective target genes
GCCAGAAGCC whose function and utility is known in the art.

TGGGGCCTCC GAM6541 is a novel bioinformatically detectable regulatory, non protein coding,
TGACGGCTCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6541 was detected is

TGCTTCTCTT described with additional reference to Figs. 9-15.

TTTACTAAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTTCTGCCA encoded by the human genome.

TGGG GAM6541 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6541
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6541

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6541 precursor RNA is designated SEQ ID:6067, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6067 is located from position 99881835 to position 99881928 relative to chromosome 13 on the `+` strand.

GAM6541 precursor RNA folds onto itself, forming GAM6541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6541 precursor RNA, designated SEQ ID NO: 6067, and a schematic representation of a predicted secondary folding of GAM6541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6541 folded precursor RNA yielding a GAM6541 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6541 RNA, hereby incorporated herein.

GAM6541 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6541 target RNA, herein designated GAM TARGET RNA. GAM6541 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6541 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6541 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6541 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6541 RNA, herein designated GAM RNA, to target binding sites on GAM6541 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6541 target RNA into GAM6541 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6541 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6541 target genes. The mRNA of each one of this plurality of GAM6541 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6541 RNA, herein designated GAM RNA, and which when bound by GAM6541 RNA causes inhibition of translation of the GAM6541 target mRNA into a corresponding GAM6541 target protein.

The mechanism of the translational inhibition exerted by GAM6541 RNA, herein designated GAM RNA, on one or more GAM6541 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6541 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6541 RNA, herein designated GAM RNA, of GAM6541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6541 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6541 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6541 RNA correlate with, and may be deduced from, the identity of the GAM6541 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6564 6725 GGCAAGATCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGCTCCAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CGTGGCCCGT Messenger 6564 (GAM6564) oligonucleotides modulates expression of respective target genes

GTTCTCTCCT whose function and utility is known in the art.

TTTGTCCCCA GAM6564 is a novel bioinformatically detectable regulatory, non protein coding,

TAGTGTGACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6564 was detected is

CCGCCAGGAA described with additional reference to Figs. 9-15.

CTTGGAATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGAAGACTG encoded by the human genome.

TGAATGAGAG GAM6564 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6564

TCATGGGTCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6564

GTGGAACGCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

CATCCCTGAC to the nucleotide sequence of GAM6564 precursor RNA is designated SEQ ID:6725, and is

C provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6725 is located from position 78873542 to position 78873672 relative to chromosome 17 on the `+` strand.

GAM6564 precursor RNA folds onto itself, forming GAM6564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6564 precursor RNA, designated SEQ ID NO: 6725, and a schematic representation of a predicted secondary folding of GAM6564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6564 folded precursor RNA yielding a GAM6564 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6564 RNA, hereby incorporated herein.

GAM6564 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6564 target RNA, herein designated GAM TARGET RNA. GAM6564 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6564 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6564 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6564 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6564 RNA, herein designated GAM RNA, to target binding sites on GAM6564 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6564 target RNA into GAM6564 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6564 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6564 target genes. The mRNA of each one of this plurality of GAM6564 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6564 RNA, herein designated GAM RNA, and which when bound by GAM6564 RNA causes inhibition of translation of the GAM6564 target mRNA into a corresponding GAM6564 target protein.

The mechanism of the translational inhibition exerted by GAM6564 RNA, herein designated GAM RNA, on one or more GAM6564 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6564 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6564 RNA, herein designated GAM RNA, of GAM6564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6564 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6564 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6564 RNA correlate with, and may be deduced from, the identity of the GAM6564 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6567 6479 GCAAAGCAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGCTTGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGATAGTGAT Messenger 6567 (GAM6567) oligonucleotides modulates expression of respective target genes

TTAGCTCAAG whose function and utility is known in the art.

AGGGAGTGAG GAM6567 is a novel bioinformatically detectable regulatory, non protein coding,

ATGTGACTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6567 was detected is

TGCCACATGT described with additional reference to Figs. 9-15.

TAAATGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6567 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6567

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6567

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6567 precursor RNA is designated SEQ ID:6479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6479 is located from position 88200970 to position 88201046 relative to chromosome 11 on the `+` strand.

GAM6567 precursor RNA folds onto itself, forming GAM6567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6567 precursor RNA, designated SEQ ID NO: 6479, and a schematic representation of a predicted secondary folding of GAM6567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6567 folded precursor RNA yielding a GAM6567 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6567 RNA, hereby incorporated herein.

GAM6567 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6567 target RNA, herein designated GAM TARGET RNA. GAM6567 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6567 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6567 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6567 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6567 RNA, herein designated GAM RNA, to target binding sites on GAM6567 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6567 target RNA into GAM6567 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6567 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6567 target genes. The mRNA of each one of this plurality of GAM6567 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6567 RNA, herein designated GAM RNA, and which when bound by GAM6567 RNA causes inhibition of translation of the GAM6567 target mRNA into a corresponding GAM6567 target protein.

The mechanism of the translational inhibition exerted by GAM6567 RNA, herein designated GAM RNA, on one or more GAM6567 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6567 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6567 RNA, herein designated GAM RNA, of GAM6567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6567 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6567 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6567 RNA correlate with, and may be deduced from, the identity of the GAM6567 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6618 6975 TAGTCTCATC CAGGTATGAC Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGTGCCACT Messenger 6618 (GAM6618) oligonucleotides modulates expression of respective target genes

GTGTCTGAAA whose function and utility is known in the art.

TTCCTGAGCA GAM6618 is a novel bioinformatically detectable regulatory, non protein coding, CCGAGGGCCG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6618 was detected is

CTTCAGGCAC described with additional reference to Figs. 9-15.

CAGGCACTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCAACCTGA encoded by the human genome.

GAGCTG GAM6618 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6618 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6618 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6618 precursor RNA is designated SEQ ID:6975, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6975 is located from position 140693627 to position 140693722 relative to chromosome 7 on the `-` strand.

GAM6618 precursor RNA folds onto itself, forming GAM6618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6618 precursor RNA, designated SEQ ID NO: 6975, and a schematic representation of a predicted secondary folding of GAM6618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6618 folded precursor RNA yielding a GAM6618 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6618 RNA, hereby incorporated herein.

GAM6618 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6618 target RNA, herein designated GAM TARGET RNA. GAM6618 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6618 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6618 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6618 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6618 RNA, herein designated GAM RNA, to target binding sites on GAM6618 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6618 target RNA into GAM6618 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6618 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6618 target genes. The mRNA of each one of this plurality of GAM6618 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6618 RNA, herein designated GAM RNA, and which when bound by GAM6618 RNA causes inhibition of translation of the GAM6618 target mRNA into a corresponding GAM6618 target protein.

The mechanism of the translational inhibition exerted by GAM6618 RNA, herein designated GAM RNA, on one or more GAM6618 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6618 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6618 RNA, herein designated GAM RNA, of GAM6618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6618 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6618 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6618 RNA correlate with, and may be deduced from, the identity of the GAM6618 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6638 6216 CTGCCTAATG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGGTGTATG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAGCTGTAG Messenger 6638 (GAM6638) oligonucleotides modulates expression of respective target genes

CATTTCTGGC whose function and utility is known in the art.

ACCTGCCAAC GAM6638 is a novel bioinformatically detectable regulatory, non protein coding,

TTGTCAGAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6638 was detected is

TGCCTTTCCC described with additional reference to Figs. 9-15.

TTCCTGGCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTGTCTATG encoded by the human genome.

TGGCAG GAM6638 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6638

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6638

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6638 precursor RNA is designated SEQ ID:6216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6216 is located from position 51855487 to position 51855582 relative to chromosome 3 on the `-` strand.

GAM6638 precursor RNA folds onto itself, forming GAM6638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6638 precursor RNA, designated SEQ ID NO: 6216, and a schematic representation of a predicted secondary folding of GAM6638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6638 folded precursor RNA yielding a GAM6638 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6638 RNA, hereby incorporated herein.

GAM6638 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6638 target RNA, herein designated GAM TARGET RNA. GAM6638 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6638 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6638 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6638 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6638 RNA, herein designated GAM RNA, to target binding sites on GAM6638 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6638 target RNA into GAM6638 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6638 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6638 target genes. The mRNA of each one of this plurality of GAM6638 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6638 RNA, herein designated GAM RNA, and which when bound by GAM6638 RNA causes inhibition of translation of the GAM6638 target mRNA into a corresponding GAM6638 target protein.

The mechanism of the translational inhibition exerted by GAM6638 RNA, herein designated GAM RNA, on one or more GAM6638 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6638 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6638 RNA, herein designated GAM RNA, of GAM6638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6638 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6638 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6638 RNA correlate with, and may be deduced from, the identity of the GAM6638 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6674 5744 AGCAGAGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGGAATGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTTCTGCTC Messenger 6674 (GAM6674) oligonucleotides modulates expression of respective target genes

TCACTGAATG whose function and utility is known in the art.

GTGGGGAACC GAM6674 is a novel bioinformatically detectable regulatory, non protein coding,

TTCAACTGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6674 was detected is

TAGCCTGTGC described with additional reference to Figs. 9-15.

T GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6674 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6674

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6674

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6674 precursor RNA is designated SEQ ID:5744, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5744 is located from position 4506790 to position 4506860 relative to chromosome 16 on the `-` strand.

GAM6674 precursor RNA folds onto itself, forming GAM6674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6674 precursor RNA, designated SEQ ID NO: 5744, and a schematic representation of a predicted secondary folding of GAM6674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6674 folded precursor RNA yielding a GAM6674 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM6674 RNA, hereby incorporated herein.

GAM6674 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6674 target RNA, herein designated GAM TARGET RNA. GAM6674 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6674 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6674 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6674 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6674 RNA, herein designated GAM RNA, to target binding sites on GAM6674 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6674 target RNA into GAM6674 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6674 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6674 target genes. The mRNA of each one of this plurality of GAM6674 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6674 RNA, herein designated GAM RNA, and which when bound by GAM6674 RNA causes inhibition of translation of the GAM6674 target mRNA into a corresponding GAM6674 target protein.

The mechanism of the translational inhibition exerted by GAM6674 RNA, herein designated GAM RNA, on one or more GAM6674 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6674 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6674 RNA, herein designated GAM RNA, of GAM6674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6674 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6674 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6674 RNA correlate with, and may be deduced from, the identity of the GAM6674 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTGTTTGTCC Messenger 6773 (GAM6773) oligonucleotides modulates expression of respective target genes

TCACCCCTGA whose function and utility is known in the art.

AGCAGATAAA GAM6773 is a novel bioinformatically detectable regulatory, non protein coding,

CACATGTAGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6773 was detected is

TGGAGGAAAA described with additional reference to Figs. 9-15.

GTGACAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTGGGTTCA encoded by the human genome.

TCAGTGGGC GAM6773 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6773

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6773

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6773 precursor RNA is designated SEQ ID:6874, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6874 is located from position 203719518 to position 203719616 relative to chromosome 1 on the `+` strand.

GAM6773 precursor RNA folds onto itself, forming GAM6773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6773 precursor RNA, designated SEQ ID NO: 6874, and a schematic representation of a predicted secondary folding of GAM6773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6773 folded precursor RNA yielding a GAM6773 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6773 RNA, hereby incorporated herein. Expression of GAM6773 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM6773 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6773 target RNA, herein designated GAM TARGET RNA. GAM6773 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6773 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6773 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6773 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6773 RNA, herein designated GAM RNA, to target binding sites on GAM6773 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6773 target RNA into GAM6773 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6773 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6773 target genes. The mRNA of each one of this plurality of GAM6773 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6773 RNA, herein designated GAM RNA, and which when bound by GAM6773 RNA causes inhibition of translation of the GAM6773 target mRNA into a corresponding GAM6773 target protein.

The mechanism of the translational inhibition exerted by GAM6773 RNA, herein designated GAM RNA, on one or more GAM6773 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6773 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6773 RNA, herein designated GAM RNA, of GAM6773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6773 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6773 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6773 RNA correlate with, and may be deduced from, the identity of the GAM6773 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCGAGATGAT Messenger 6774 (GAM6774) oligonucleotides modulates expression of respective target genes

GTTTGGGTTT whose function and utility is known in the art.

GTGCTGGACA GAM6774 is a novel bioinformatically detectable regulatory, non protein coding,

TTCCTGAGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6774 was detected is

GAGCCAGAGG described with additional reference to Figs. 9-15.

TGAGTCTTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTTGTTGGG encoded by the human genome.

GAGAGCAG GAM6774 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6774

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6774

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6774 precursor RNA is designated SEQ ID:6210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6210 is located from position 175687263 to position 175687360 relative to chromosome 5 on the `+` strand.

GAM6774 precursor RNA folds onto itself, forming GAM6774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6774 precursor RNA, designated SEQ ID NO: 6210, and a schematic representation of a predicted secondary folding of GAM6774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6774 folded precursor RNA yielding a GAM6774 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM6774 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6774 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM6774 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6774 target RNA, herein designated GAM TARGET RNA. GAM6774 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6774 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6774 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6774 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6774 RNA, herein designated GAM RNA, to target binding sites on GAM6774 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6774 target RNA into GAM6774 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6774 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6774 target genes. The mRNA of each one of this plurality of GAM6774 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6774 RNA, herein

designated GAM RNA, and which when bound by GAM6774 RNA causes inhibition of translation of the GAM6774 target mRNA into a corresponding GAM6774 target protein.

The mechanism of the translational inhibition exerted by GAM6774 RNA, herein designated GAM RNA, on one or more GAM6774 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6774 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6774 RNA, herein designated GAM RNA, of GAM6774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6774 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6774 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6774 RNA correlate with, and may be deduced from, the identity of the GAM6774 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6799 6991 TCACCCAGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
GTTCTCTCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACAGACAT Messenger 6799 (GAM6799) oligonucleotides modulates expression of respective target genes
GTCCAGTGGA whose function and utility is known in the art.

CCGTAGTGTT GAM6799 is a novel bioinformatically detectable regulatory, non protein coding,
GTGACGGTCG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6799 was detected is

CCCATCTGCG described with additional reference to Figs. 9-15.

CCCAGTACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGGATCATGC encoded by the human genome.

GGAACATGTT GAM6799 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6799
GTCAAAGCTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6799

CAGATTGCCT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
GTGA to the nucleotide sequence of GAM6799 precursor RNA is designated SEQ ID:6991, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6991 is located from position 56320939 to position 56321062 relative to chromosome 12 on the `-` strand.

GAM6799 precursor RNA folds onto itself, forming GAM6799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6799 precursor RNA, designated SEQ ID NO: 6991, and a schematic representation of a predicted secondary folding of GAM6799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6799 folded precursor RNA yielding a GAM6799 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6799 RNA, hereby incorporated herein.

GAM6799 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6799 target RNA, herein designated GAM TARGET RNA. GAM6799 target
RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6799 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6799 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6799 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6799 RNA, herein designated GAM RNA, to target binding sites on GAM6799 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6799 target RNA into GAM6799 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6799 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6799 target genes. The mRNA of each one of this plurality of GAM6799 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6799 RNA, herein designated GAM RNA, and which when bound by GAM6799 RNA causes inhibition of translation of the GAM6799 target mRNA into a corresponding GAM6799 target protein.

The mechanism of the translational inhibition exerted by GAM6799 RNA, herein designated GAM RNA, on one or more GAM6799 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6799 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6799 RNA, herein designated GAM RNA, of GAM6799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6799 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6799 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6799 RNA correlate with, and may be deduced from, the identity of the GAM6799 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6807 6137 CGAGTGATTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAGGTAAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TATGTTATTG Messenger 6807 (GAM6807) oligonucleotides modulates expression of respective target genes

GAAAGGTGTG whose function and utility is known in the art.

ATCTATATAG GAM6807 is a novel bioinformatically detectable regulatory, non protein coding,

AACCCTGTAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6807 was detected is

ATGAAAAGGA described with additional reference to Figs. 9-15.

GGAGATGCCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTATCTTGGC encoded by the human genome.

AGGGATGATC GAM6807 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6807
ATGTATTTGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6807
AATAGTAACT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CACAGCATTT to the nucleotide sequence of GAM6807 precursor RNA is designated SEQ ID:6137, and is

G provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6137 is located from position 121833616 to position 121833746 relative to chromosome 10 on the `+` strand.

GAM6807 precursor RNA folds onto itself, forming GAM6807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6807 precursor RNA, designated SEQ ID NO: 6137, and a schematic representation of a predicted secondary folding of GAM6807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6807 folded precursor RNA yielding a GAM6807 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6807 RNA, hereby incorporated herein.

GAM6807 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6807 target RNA, herein designated GAM TARGET RNA. GAM6807 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6807 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6807 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6807 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6807 RNA, herein designated GAM RNA, to target binding sites on GAM6807 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6807 target RNA into GAM6807 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6807 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6807 target genes. The mRNA of each one of this plurality of GAM6807 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6807 RNA, herein designated GAM RNA, and which when bound by GAM6807 RNA causes inhibition of translation of the GAM6807 target mRNA into a corresponding GAM6807 target protein.

The mechanism of the translational inhibition exerted by GAM6807 RNA, herein designated GAM RNA, on one or more GAM6807 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6807 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6807 RNA, herein designated GAM RNA, of GAM6807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6807 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6807 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6807 RNA correlate with, and may be deduced from, the identity of the GAM6807 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6811 6248 CTGTTTCCTA Fig. 8 further provides a conceptual description of another novel bioinformatically
TAGGTGCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGATCAGGT Messenger 6811 (GAM6811) oligonucleotides modulates expression of respective target genes
TCCTGATTGG whose function and utility is known in the art.

AGTTCTCTTA GAM6811 is a novel bioinformatically detectable regulatory, non protein coding,
TCTGCTCTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6811 was detected is

TTTGGAGGGC described with additional reference to Figs. 9-15.

TGCCCCATTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGAATCTGT encoded by the human genome.

TTTGTTTTGC GAM6811 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6811

TCAAATACAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6811

TCAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6811 precursor RNA is designated SEQ ID:6248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6248 is located from position 110102077 to position 110102190 relative to chromosome 13 on the `-` strand.

GAM6811 precursor RNA folds onto itself, forming GAM6811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6811 precursor RNA, designated SEQ ID NO: 6248, and a schematic representation of a predicted secondary folding of GAM6811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6811 folded precursor RNA yielding a GAM6811 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6811 RNA, hereby incorporated herein.

GAM6811 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6811 target RNA, herein designated GAM TARGET RNA. GAM6811 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6811 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6811 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6811 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6811 RNA, herein designated GAM RNA, to target binding sites on GAM6811 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6811 target RNA into GAM6811 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6811 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6811 target genes. The mRNA of each one of this plurality of GAM6811 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6811 RNA, herein designated GAM RNA, and which when bound by GAM6811 RNA causes inhibition of translation of the GAM6811 target mRNA into a corresponding GAM6811 target protein.

The mechanism of the translational inhibition exerted by GAM6811 RNA, herein designated GAM RNA, on one or more GAM6811 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6811 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6811 RNA, herein designated GAM RNA, of GAM6811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6811 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6811 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6811 RNA correlate with, and may be deduced from, the identity of the GAM6811 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6818 6826 GGGTTCTTTT TCCGCTTTCT GAGCCCTTTT Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 6818 (GAM6818) oligonucleotides modulates expression of respective target genes

ATACCTTACG whose function and utility is known in the art.

TTTAGAAGGG GAM6818 is a novel bioinformatically detectable regulatory, non protein coding, GAAAATCATC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6818 was detected is

CTCCC described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6818 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6818

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6818

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6818 precursor RNA is designated SEQ ID:6826, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6826 is located from position 122713355 to position 122713419 relative to chromosome 7 on the `-` strand.

GAM6818 precursor RNA folds onto itself, forming GAM6818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6818 precursor RNA, designated SEQ ID NO: 6826, and a schematic representation of a predicted secondary folding of GAM6818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6818 folded precursor RNA yielding a GAM6818 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6818 RNA, hereby incorporated herein.

GAM6818 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6818 target RNA, herein designated GAM TARGET RNA. GAM6818 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6818 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6818 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6818 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6818 RNA, herein designated GAM RNA, to target binding sites on GAM6818 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6818 target RNA into GAM6818 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6818 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6818 target genes. The mRNA of each one of this plurality of GAM6818 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6818 RNA, herein designated GAM RNA, and which when bound by GAM6818 RNA causes inhibition of translation of the GAM6818 target mRNA into a corresponding GAM6818 target protein.

The mechanism of the translational inhibition exerted by GAM6818 RNA, herein designated GAM RNA, on one or more GAM6818 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6818 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

TTCTGGGGAA whose function and utility is known in the art.

AGAAAGCCAG GAM6840 is a novel bioinformatically detectable regulatory, non protein coding,

CTGAATTTTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM6840 was detected is

ACTCCATCTC described with additional reference to Figs. 9-15.

CCCAGAAGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTGGG encoded by the human genome.

GAM6840 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6840

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6840

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6840 precursor RNA is designated SEQ ID:7022, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7022 is located from position 40508403 to position 40508488 relative to chromosome 19 on the `+` strand.

GAM6840 precursor RNA folds onto itself, forming GAM6840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6840 precursor RNA, designated SEQ ID NO: 7022, and a schematic representation of a predicted secondary folding of GAM6840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6840 folded precursor RNA yielding a GAM6840 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM6840 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6840 RNA and an

alternative nucleotide sequence thereof, hereby incorporated herein.

GAM6840 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6840 target RNA, herein designated GAM TARGET RNA. GAM6840 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6840 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6840 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6840 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6840 RNA, herein designated GAM RNA, to target binding sites on GAM6840 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6840 target RNA into GAM6840 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6840 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6840 target genes. The mRNA of each one of this plurality of GAM6840 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6840 RNA, herein designated GAM RNA, and which when bound by GAM6840 RNA causes inhibition of translation of the GAM6840 target mRNA into a corresponding GAM6840 target protein.

The mechanism of the translational inhibition exerted by GAM6840 RNA, herein designated GAM RNA, on one or more GAM6840 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6840 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6840 RNA, herein designated GAM RNA, of GAM6840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6840 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6840 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6840 RNA correlate with, and may be deduced from, the identity of the GAM6840 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6842 6993 TCACGTCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GCAAAGTAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
AAGTGGTTAT Messenger 6842 (GAM6842) oligonucleotides modulates expression of respective target genes
GTTCATATCA whose function and utility is known in the art.

TTTTGAAAGC GAM6842 is a novel bioinformatically detectable regulatory, non protein coding,
TGAGTGGATA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6842 was detected is

GATTTAAATA described with additional reference to Figs. 9-15.

GCAAGAGCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTTCGGAAT encoded by the human genome.

GATGTGTGGA GAM6842 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6842
ACCCAGAATC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6842
ACAGACCCTG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
CGATACATGA to the nucleotide sequence of GAM6842 precursor RNA is designated SEQ ID:6993, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6993 is located from position 22646286 to position 22646415 relative to chromosome 18 on the `-` strand.

GAM6842 precursor RNA folds onto itself, forming GAM6842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6842 precursor RNA, designated SEQ ID NO: 6993, and a schematic representation of a predicted secondary folding of GAM6842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6842 folded precursor RNA yielding a GAM6842 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6842 RNA, hereby incorporated herein.

GAM6842 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6842 target RNA, herein designated GAM TARGET RNA. GAM6842 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6842 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6842 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6842 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6842 RNA, herein designated GAM RNA, to target binding sites on GAM6842 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6842 target RNA into GAM6842 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6842 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6842 target genes. The mRNA of each one of this plurality of GAM6842 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6842 RNA, herein designated GAM RNA, and which when bound by GAM6842 RNA causes inhibition of translation of the GAM6842 target mRNA into a corresponding GAM6842 target protein.

The mechanism of the translational inhibition exerted by GAM6842 RNA, herein designated GAM RNA, on one or more GAM6842 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6842 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6842 RNA, herein designated GAM RNA, of GAM6842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6842 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6842 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6842 RNA correlate with, and may be deduced from, the identity of the GAM6842 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6858 5988 CAAGCAGTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGGTGCAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TCATGGATAG Messenger 6858 (GAM6858) oligonucleotides modulates expression of respective target genes

AGCTTTCAAG whose function and utility is known in the art.

AAGTTTGTTC GAM6858 is a novel bioinformatically detectable regulatory, non protein coding,

TAGTTCTTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6858 was detected is

CCTGAAACTG described with additional reference to Figs. 9-15.

GACCTCCCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTAGCTTG encoded by the human genome.

GAM6858 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6858

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6858

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6858 precursor RNA is designated SEQ ID:5988, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5988 is located from position 118137371 to position 118137458 relative to chromosome X on the `+` strand.

GAM6858 precursor RNA folds onto itself, forming GAM6858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6858 precursor RNA, designated SEQ ID NO: 5988, and a schematic representation of a predicted secondary folding of GAM6858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6858 folded precursor RNA yielding a GAM6858 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6858 RNA, hereby incorporated herein.

GAM6858 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6858 target RNA, herein designated GAM TARGET RNA. GAM6858 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6858 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6858 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6858 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6858 RNA, herein designated GAM RNA, to target binding sites on GAM6858 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6858 target RNA into GAM6858 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6858 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6858 target genes. The mRNA of each one of this plurality of GAM6858 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6858 RNA, herein designated GAM RNA, and which when bound by GAM6858 RNA causes inhibition of translation of the GAM6858 target mRNA into a corresponding GAM6858 target protein.

The mechanism of the translational inhibition exerted by GAM6858 RNA, herein designated GAM RNA, on one or more GAM6858 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6858 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6858 RNA, herein designated GAM RNA, of GAM6858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6858 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6858 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6858 RNA correlate with, and may be deduced from, the identity of the GAM6858 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6978 6028 CAGGTATGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGTGCCACT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGTCTGAAA Messenger 6978 (GAM6978) oligonucleotides modulates expression of respective target genes

TTCCTGAGCA whose function and utility is known in the art.

CCGAGGGCCG GAM6978 is a novel bioinformatically detectable regulatory, non protein coding,

CTTCAGGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM6978 was detected is

CAGGCACTTT described with additional reference to Figs. 9-15.

GCCAACCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6978 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6978

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6978

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6978 precursor RNA is designated SEQ ID:6028, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6028 is located from position 140693634 to position 140693712 relative to chromosome 7 on the `-` strand.

GAM6978 precursor RNA folds onto itself, forming GAM6978 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6978 precursor RNA, designated SEQ ID NO: 6028, and a schematic representation of a predicted secondary folding of GAM6978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6978 folded precursor RNA yielding a GAM6978 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6978 RNA, hereby incorporated herein.

GAM6978 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6978 target RNA, herein designated GAM TARGET RNA. GAM6978 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6978 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6978 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6978 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6978 RNA, herein designated GAM RNA, to target binding sites on GAM6978 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6978 target RNA into GAM6978 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6978 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6978 target genes. The mRNA of each one of this plurality of GAM6978 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6978 RNA, herein designated GAM RNA, and which when bound by GAM6978 RNA causes inhibition of translation of the GAM6978 target mRNA into a corresponding GAM6978 target protein.

The mechanism of the translational inhibition exerted by GAM6978 RNA, herein designated GAM RNA, on one or more GAM6978 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6978 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6978 RNA, herein designated GAM RNA, of GAM6978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6978 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6978 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6978 RNA correlate with, and may be deduced from, the identity of the GAM6978 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6982 6040 CATGGGGTCG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCCTCAGGG Messenger 6982 (GAM6982) oligonucleotides modulates expression of respective target genes

AAGGCAGTAG whose function and utility is known in the art.

GTTGTATAGT GAM6982 is a novel bioinformatically detectable regulatory, non protein coding,

TATCTTCCGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6982 was detected is

GGGGCAACAT described with additional reference to Figs. 9-15.

CACTGCCCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAACCACACA encoded by the human genome.

ACCTACTACC GAM6982 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6982

TCACCCCGCC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6982

AGGCCCGGCC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TTGCACTGCG to the nucleotide sequence of GAM6982 precursor RNA is designated SEQ ID:6040, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6040 is located from position 44721785 to position 44721914 relative to chromosome 22 on the `-` strand.

GAM6982 precursor RNA folds onto itself, forming GAM6982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6982 precursor RNA, designated SEQ ID NO: 6040, and a schematic representation of a predicted secondary folding of GAM6982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6982 folded precursor RNA yielding a GAM6982 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6982 RNA, hereby incorporated herein. Expression of GAM6982 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM6982 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6982 target RNA, herein designated GAM TARGET RNA. GAM6982 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6982 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6982 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6982 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6982 RNA, herein designated GAM RNA, to target binding sites on GAM6982 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6982 target RNA

into GAM6982 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6982 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6982 target genes. The mRNA of each one of this plurality of GAM6982 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6982 RNA, herein designated GAM RNA, and which when bound by GAM6982 RNA causes inhibition of translation of the GAM6982 target mRNA into a corresponding GAM6982 target protein.

The mechanism of the translational inhibition exerted by GAM6982 RNA, herein designated GAM RNA, on one or more GAM6982 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6982 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6982 RNA, herein designated GAM RNA, of GAM6982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6982 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6982 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6982 RNA correlate with, and may be deduced from, the identity of the GAM6982 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6994 7204 TGCTCTGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTAGGCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTGCAGTGA Messenger 6994 (GAM6994) oligonucleotides modulates expression of respective target genes

TGCAATTTTG whose function and utility is known in the art.

GCTCACTGCA GAM6994 is a novel bioinformatically detectable regulatory, non protein coding,

ACCTCCACCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM6994 was detected is

CCTGGGTTCA described with additional reference to Figs. 9-15.

AGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM6994 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6994 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6994 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6994 precursor RNA is designated SEQ ID:7204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7204 is located from position 44650573 to position 44650646 relative to chromosome 19 on the `+` strand.

GAM6994 precursor RNA folds onto itself, forming GAM6994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6994 precursor RNA, designated SEQ ID NO: 7204, and a schematic representation of a predicted secondary folding of GAM6994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6994 folded precursor RNA yielding a GAM6994 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6994 RNA, hereby incorporated herein.

GAM6994 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6994 target RNA, herein designated GAM TARGET RNA. GAM6994 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6994 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6994 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6994 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6994 RNA, herein designated GAM RNA, to target binding sites on GAM6994 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6994 target RNA into GAM6994 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6994 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6994 target genes. The mRNA of each one of this plurality of GAM6994 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6994 RNA, herein designated GAM RNA, and which when bound by GAM6994 RNA causes inhibition of translation of the GAM6994 target mRNA into a corresponding GAM6994 target protein.

The mechanism of the translational inhibition exerted by GAM6994 RNA, herein designated GAM RNA, on one or more GAM6994 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6994 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6994 RNA, herein designated GAM RNA, of GAM6994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6994 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6994 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6994 RNA correlate with, and may be deduced from, the identity of the GAM6994 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM6996 7025 TCCCAGATTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCCTGGTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCATTCGG Messenger 6996 (GAM6996) oligonucleotides modulates expression of respective target genes

AGAGCAACAC whose function and utility is known in the art.

CCTGGCCTTA GAM6996 is a novel bioinformatically detectable regulatory, non protein coding,

ACACACTACA micro RNA (miRNA)-like oligonucleotide. The method by which GAM6996 was detected is

TATCTTTGAA described with additional reference to Figs. 9-15.

TTTCACACGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGCAGCCTT encoded by the human genome.

CTGGGA GAM6996 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM6996 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM6996 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM6996 precursor RNA is designated SEQ ID:7025, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7025 is located from position 6197081 to position 6197176 relative to chromosome 17 on the `-` strand.

GAM6996 precursor RNA folds onto itself, forming GAM6996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM6996 precursor RNA, designated SEQ ID NO: 7025, and a schematic representation of a predicted secondary folding of GAM6996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM6996 folded precursor RNA yielding a GAM6996 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM6996 RNA, hereby incorporated herein.

GAM6996 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM6996 target RNA, herein designated GAM TARGET RNA. GAM6996 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM6996 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM6996 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM6996 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM6996 RNA, herein designated GAM RNA, to target binding sites on GAM6996 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM6996 target RNA into GAM6996 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM6996 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM6996 target genes. The mRNA of each one of this plurality of GAM6996 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM6996 RNA, herein designated GAM RNA, and which when bound by GAM6996 RNA causes inhibition of translation of the GAM6996 target mRNA into a corresponding GAM6996 target protein.

The mechanism of the translational inhibition exerted by GAM6996 RNA, herein designated GAM RNA, on one or more GAM6996 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM6996 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM6996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM6996 RNA, herein designated GAM RNA, of GAM6996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM6996 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM6996 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM6996 RNA correlate with, and may be deduced from, the identity of the GAM6996 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7017 6299 GAATAAATAA GCTGCTCTAA TTGCCAAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7017 (GAM7017) oligonucleotides modulates expression of respective target genes

TTCACATGTG whose function and utility is known in the art.

GTTGTATGCA GAM7017 is a novel bioinformatically detectable regulatory, non protein coding,
GCATTACTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7017 was detected is

GAAATTGAAG described with additional reference to Figs. 9-15.

TGTATCTGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTGATTCTG encoded by the human genome.

CTGTGATGGA GAM7017 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7017
CACTTGTAAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7017
TTTGTTC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7017 precursor RNA is designated SEQ ID:6299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6299 is located from position 43025637 to position 43025753 relative to chromosome 9 on the `-` strand.

GAM7017 precursor RNA folds onto itself, forming GAM7017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7017 precursor RNA, designated SEQ ID NO: 6299, and a schematic representation of a predicted secondary folding of GAM7017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7017 folded precursor RNA yielding a GAM7017 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7017 RNA, hereby incorporated herein.

GAM7017 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7017 target RNA, herein designated GAM TARGET RNA. GAM7017 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7017 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7017 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7017 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7017 RNA, herein designated GAM RNA, to target binding sites on GAM7017 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7017 target RNA into GAM7017 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7017 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7017 target genes. The mRNA of each one of this plurality of GAM7017 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7017 RNA, herein designated GAM RNA, and which when bound by GAM7017 RNA causes inhibition of translation of the GAM7017 target mRNA into a corresponding GAM7017 target protein.

The mechanism of the translational inhibition exerted by GAM7017 RNA, herein designated GAM RNA, on one or more GAM7017 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7017 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7017 RNA, herein designated GAM RNA, of GAM7017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7017 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7017 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7017 RNA correlate with, and may be deduced from, the identity of the GAM7017 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AATAGTTACC whose function and utility is known in the art.

GAGGGGAAGT GAM7022 is a novel bioinformatically detectable regulatory, non protein coding,
TACAGGCCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7022 was detected is

AGTGTGAGTC described with additional reference to Figs. 9-15.

CCTGTTTGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCTGATGAG encoded by the human genome.

CTTTGAGGTC GAM7022 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7022
CTTGGCCAGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7022
CACTC precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7022 precursor RNA is designated SEQ ID:6822, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6822 is located from position 47741101 to position 47741215 relative to chromosome X on the `-` strand.

GAM7022 precursor RNA folds onto itself, forming GAM7022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7022 precursor RNA, designated SEQ ID NO: 6822, and a schematic representation of a predicted secondary folding of GAM7022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7022 folded precursor RNA yielding a GAM7022 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7022 RNA, hereby incorporated herein.

GAM7022 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7022 target RNA, herein designated GAM TARGET RNA. GAM7022 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7022 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7022 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7022 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7022 RNA, herein designated GAM RNA, to target binding sites on GAM7022 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7022 target RNA into GAM7022 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7022 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7022 target genes. The mRNA of each one of this plurality of GAM7022 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7022 RNA, herein designated GAM RNA, and which when bound by GAM7022 RNA causes inhibition of translation of the GAM7022 target mRNA into a corresponding GAM7022 target protein.

The mechanism of the translational inhibition exerted by GAM7022 RNA, herein designated GAM RNA, on one or more GAM7022 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7022 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7022 RNA, herein designated GAM RNA, of GAM7022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7022 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7022 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7022 RNA correlate with, and may be deduced from, the identity of the GAM7022 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7067 6108 CCTCAGCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAM7067 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7067 target RNA, herein designated GAM TARGET RNA. GAM7067 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7067 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7067 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7067 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7067 RNA, herein designated GAM RNA, to target binding sites on GAM7067 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7067 target RNA into GAM7067 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7067 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7067 target genes. The mRNA of each one of this plurality of GAM7067 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7067 RNA, herein designated GAM RNA, and which when bound by GAM7067 RNA causes inhibition of translation of the GAM7067 target mRNA into a corresponding GAM7067 target protein.

The mechanism of the translational inhibition exerted by GAM7067 RNA, herein designated GAM RNA, on one or more GAM7067 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7067 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7067 RNA, herein designated GAM RNA, of GAM7067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM7067 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7067 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7067 RNA correlate with, and may be deduced from, the identity of the GAM7067 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7078 6907 GTGCTAGGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
GTCACCTATG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGGAGCCAG Messenger 7078 (GAM7078) oligonucleotides modulates expression of respective target genes
CTCTGCCTCC whose function and utility is known in the art.

TGCCCCGAAG GAM7078 is a novel bioinformatically detectable regulatory, non protein coding,
CTCCAGAGAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7078 was detected is

TTCTCCTACA described with additional reference to Figs. 9-15.

ACTGACTCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGACAC encoded by the human genome.

GAM7078 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7078

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7078
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7078 precursor RNA is designated SEQ ID:6907, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6907 is located from position 38614091 to position 38614177 relative to chromosome 17 on the `-` strand.

GAM7078 precursor RNA folds onto itself, forming GAM7078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7078 precursor RNA, designated SEQ ID NO: 6907, and a schematic representation of a predicted secondary folding of GAM7078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7078 folded precursor RNA yielding a GAM7078 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7078 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7078 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7078 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7078 target RNA, herein designated GAM TARGET RNA. GAM7078 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7078 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7078 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7078 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7078 RNA, herein designated GAM RNA, to target binding sites on GAM7078 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7078 target RNA into GAM7078 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7078 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7078 target genes. The mRNA of each one of this plurality of GAM7078 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7078 RNA, herein designated GAM RNA, and which when bound by GAM7078 RNA causes inhibition of translation of the GAM7078 target mRNA into a corresponding GAM7078 target protein.

The mechanism of the translational inhibition exerted by GAM7078 RNA, herein designated GAM RNA, on one or more GAM7078 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7078 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7078 RNA, herein designated GAM RNA, of GAM7078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7078 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7078 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7078 RNA correlate with, and may be deduced from, the identity of the GAM7078 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7080 6064 CCATTTTTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAGGTCAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTGGTTGCA Messenger 7080 (GAM7080) oligonucleotides modulates expression of respective target genes

AACTGGATTT whose function and utility is known in the art.

TTAGACTCTT GAM7080 is a novel bioinformatically detectable regulatory, non protein coding,

CCTGTTGGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7080 was detected is

GTCTCGGACA described with additional reference to Figs. 9-15.

TTTGCTCTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCACAGCGG encoded by the human genome.

CCAATTCTTC GAM7080 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7080

AGAGCCACAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7080

AGAACTGG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7080 precursor RNA is designated SEQ ID:6064, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6064 is located from position 1047334 to position 1047441 relative to chromosome 1 on the `-` strand.

GAM7080 precursor RNA folds onto itself, forming GAM7080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7080 precursor RNA, designated SEQ ID NO: 6064, and a

schematic representation of a predicted secondary folding of GAM7080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7080 folded precursor RNA yielding a GAM7080 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7080 RNA, hereby incorporated herein. Expression of GAM7080 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7080 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7080 target RNA, herein designated GAM TARGET RNA. GAM7080 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7080 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7080 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7080 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7080 RNA, herein designated GAM RNA, to target binding sites on GAM7080 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7080 target RNA into GAM7080 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7080 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7080 target genes. The mRNA of each one of this plurality of GAM7080 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7080 RNA, herein designated GAM RNA, and which when bound by GAM7080 RNA causes inhibition of translation of the GAM7080 target mRNA into a corresponding GAM7080 target protein.

The mechanism of the translational inhibition exerted by GAM7080 RNA, herein designated GAM RNA, on one or more GAM7080 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7080 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7080 RNA, herein designated GAM RNA, of GAM7080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7080 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7080 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7080 RNA correlate with, and may be deduced from, the identity of the GAM7080 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7095 7015 TCATCTATCC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTAGGCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTATCTTAT Messenger 7095 (GAM7095) oligonucleotides modulates expression of respective target genes

CAGCTACTGA whose function and utility is known in the art.

CCCAGTTAGC GAM7095 is a novel bioinformatically detectable regulatory, non protein coding,

TTTCCTACTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7095 was detected is

CACAACAGGT described with additional reference to Figs. 9-15.

TTCTAATGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTATGTCAGT encoded by the human genome.

GTGAGAGAAA GAM7095 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7095

TGGCAAGTTG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7095

GGAAAATTTG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

TGA to the nucleotide sequence of GAM7095 precursor RNA is designated SEQ ID:7015, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7015 is located from position 104082522 to position 104082644 relative to chromosome 7 on the `+` strand.

GAM7095 precursor RNA folds onto itself, forming GAM7095 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7095 precursor RNA, designated SEQ ID NO: 7015, and a schematic representation of a predicted secondary folding of GAM7095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7095 folded precursor RNA yielding a GAM7095 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7095 RNA, hereby incorporated herein.

GAM7095 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7095 target RNA, herein designated GAM TARGET RNA. GAM7095 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7095 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7095 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7095 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7095 RNA, herein designated GAM RNA, to target binding sites on GAM7095 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7095 target RNA into GAM7095 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7095 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7095 target genes. The mRNA of each one of this plurality of GAM7095 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7095 RNA, herein designated GAM RNA, and which when bound by GAM7095 RNA causes inhibition of translation of the GAM7095 target mRNA into a corresponding GAM7095 target protein.

The mechanism of the translational inhibition exerted by GAM7095 RNA, herein designated GAM RNA, on one or more GAM7095 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7095 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7095 RNA, herein designated GAM RNA, of GAM7095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7095 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7095 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7095 RNA correlate with, and may be deduced from, the identity of the GAM7095 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7102 6994 TCACTCTGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCCAGGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGTGCAGTG Messenger 7102 (GAM7102) oligonucleotides modulates expression of respective target genes

GTACAGCCTC whose function and utility is known in the art.

AGCTCACTGC GAM7102 is a novel bioinformatically detectable regulatory, non protein coding,

AACCTCCACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7102 was detected is

TCCCGGGCTC described with additional reference to Figs. 9-15.

AAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7102 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7102

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7102

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7102 precursor RNA is designated SEQ ID:6994, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6994 is located from position 152542921 to position 152542996 relative to chromosome 1 on the `+` strand.

GAM7102 precursor RNA folds onto itself, forming GAM7102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7102 precursor RNA, designated SEQ ID NO: 6994, and a schematic representation of a predicted secondary folding of GAM7102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7102 folded precursor RNA yielding a GAM7102 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7102 RNA, hereby incorporated herein.

GAM7102 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7102 target RNA, herein designated GAM TARGET RNA. GAM7102 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7102 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7102 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7102 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7102 RNA, herein designated GAM RNA, to target binding sites on GAM7102 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7102 target RNA into GAM7102 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7102 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM7102 target genes. The mRNA of each one of this plurality of GAM7102 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7102 RNA, herein designated GAM RNA, and which when bound by GAM7102 RNA causes inhibition of translation of the GAM7102 target mRNA into a corresponding GAM7102 target protein.

The mechanism of the translational inhibition exerted by GAM7102 RNA, herein designated GAM RNA, on one or more GAM7102 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7102 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7102 RNA, herein designated GAM RNA, of GAM7102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7102 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7102 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7102 RNA correlate with, and may be deduced from, the identity of the GAM7102 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7124 5817 AGTGTCTCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GATTGCACGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACATTTCATT Messenger 7124 (GAM7124) oligonucleotides modulates expression of respective target genes

TTTCACACAG whose function and utility is known in the art.

GGTCACCAGA GAM7124 is a novel bioinformatically detectable regulatory, non protein coding,

ATACCATCAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7124 was detected is

TTTTTTGGTA described with additional reference to Figs. 9-15.

TCACTGTCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGTGATCCT encoded by the human genome.

AGCACCTTCT GAM7124 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7124

GAAATAACGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7124

GAGCTGCCAG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

ATTCT to the nucleotide sequence of GAM7124 precursor RNA is designated SEQ ID:5817, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5817 is located from position 75288695 to position 75288819 relative to chromosome 16 on the `+` strand.

GAM7124 precursor RNA folds onto itself, forming GAM7124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7124 precursor RNA, designated SEQ ID NO: 5817, and a schematic representation of a predicted secondary folding of GAM7124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7124 folded precursor RNA yielding a GAM7124 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7124 RNA, hereby incorporated herein.

GAM7124 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7124 target RNA, herein designated GAM TARGET RNA. GAM7124 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7124 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7124 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7124 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7124 RNA, herein designated GAM RNA, to target binding sites on GAM7124 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7124 target RNA into GAM7124 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7124 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7124 target genes. The mRNA of each one of this plurality of GAM7124 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7124 RNA, herein designated GAM RNA, and which when bound by GAM7124 RNA causes inhibition of translation of the GAM7124 target mRNA into a corresponding GAM7124 target protein.

The mechanism of the translational inhibition exerted by GAM7124 RNA, herein designated GAM RNA, on one or more GAM7124 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7124 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7124 RNA, herein designated GAM RNA, of GAM7124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7124 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7124 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7124 RNA correlate with, and may be deduced from, the identity of the GAM7124 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7135 7216 TGGACTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGGGCCTT Messenger 7140 (GAM7140) oligonucleotides modulates expression of respective target genes

GGCTGGGATG whose function and utility is known in the art.

CTGAGTTATC GAM7140 is a novel bioinformatically detectable regulatory, non protein coding, CACTGGAGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7140 was detected is

TCGGCAGTAC described with additional reference to Figs. 9-15.

AGGCAGGCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGGCAGTG encoded by the human genome.

GATCCATCGG GAM7140 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7140

AGGTGGCAGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7140

T precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7140 precursor RNA is designated SEQ ID:6498, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6498 is located from position 69762447 to position 69762557 relative to chromosome 16 on the `+` strand.

GAM7140 precursor RNA folds onto itself, forming GAM7140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7140 precursor RNA, designated SEQ ID NO: 6498, and a schematic representation of a predicted secondary folding of GAM7140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7140 folded precursor RNA yielding a GAM7140 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7140 RNA, hereby incorporated herein.

GAM7140 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7140 target RNA, herein designated GAM TARGET RNA. GAM7140 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7140 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7140 RNA, herein designated GAM RNA, to target binding sites on GAM7140 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7140 target RNA into GAM7140 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7140 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7140 target genes. The mRNA of each one of this plurality of GAM7140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7140 RNA, herein designated GAM RNA, and which when bound by GAM7140 RNA causes inhibition of translation of the GAM7140 target mRNA into a corresponding GAM7140 target protein.

The mechanism of the translational inhibition exerted by GAM7140 RNA, herein designated GAM RNA, on one or more GAM7140 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7140 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7140 RNA, herein designated GAM RNA, of GAM7140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7140 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7140 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7140 RNA correlate with, and may be deduced from, the identity of the GAM7140 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7146 5979 ATTATGTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTAGTATGTA detected oligonucleotides of the present invention, referred to here as Genomic Address
TATAGTATTT Messenger 7146 (GAM7146) oligonucleotides modulates expression of respective target genes
TTAGTGAAAA whose function and utility is known in the art.

TATTCATATA GAM7146 is a novel bioinformatically detectable regulatory, non protein coding,
AAATATTACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7146 was detected is

TAAATCATTT described with additional reference to Figs. 9-15.

CTACATTGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAAAT encoded by the human genome.

GAM7146 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7146

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7146

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7146 precursor RNA is designated SEQ ID:5979, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5979 is located from position 35139835 to position 35139920 relative to chromosome 13 on the `+` strand.

GAM7146 precursor RNA folds onto itself, forming GAM7146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7146 precursor RNA, designated SEQ ID NO: 5979, and a schematic representation of a predicted secondary folding of GAM7146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7146 folded precursor RNA yielding a GAM7146 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7146 RNA, hereby incorporated herein.

GAM7146 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7146 target RNA, herein designated GAM TARGET RNA. GAM7146 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7146 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7146 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7146 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7146 RNA, herein designated GAM RNA, to target binding sites on GAM7146 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7146 target RNA into GAM7146 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7146 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7146 target genes. The mRNA of each one of this plurality of GAM7146 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7146 RNA, herein designated GAM RNA, and which when bound by GAM7146 RNA causes inhibition of translation of the GAM7146 target mRNA into a corresponding GAM7146 target protein.

The mechanism of the translational inhibition exerted by GAM7146 RNA, herein designated GAM RNA, on one or more GAM7146 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7146 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7146 RNA, herein designated GAM RNA, of GAM7146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7146 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7146 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7146 RNA correlate with, and may be deduced from, the identity of the GAM7146 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7162 5828 AGTTTAAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTCGCAAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGGGTGGC Messenger 7162 (GAM7162) oligonucleotides modulates expression of respective target genes
CTTCAGTCCA whose function and utility is known in the art.

TGAAAGAGAA GAM7162 is a novel bioinformatically detectable regulatory, non protein coding,
CACATCTGTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7162 was detected is

CTATCTCAGG described with additional reference to Figs. 9-15.

CTGAGGTCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTGCATCCTC encoded by the human genome.

ATCAATAAGC GAM7162 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7162
T precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7162
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7162 precursor RNA is designated SEQ ID:5828, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5828 is located from position 53192373 to position 53192473 relative to chromosome 20 on the `+` strand.

GAM7162 precursor RNA folds onto itself, forming GAM7162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7162 precursor RNA, designated SEQ ID NO: 5828, and a schematic representation of a predicted secondary folding of GAM7162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7162 folded precursor RNA yielding a GAM7162 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7162 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7162 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7162 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7162 target RNA, herein designated GAM TARGET RNA. GAM7162 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7162 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7162 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7162 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7162 RNA, herein designated GAM RNA, to target binding sites on GAM7162 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7162 target RNA into GAM7162 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7162 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7162 target genes. The mRNA of each one of this plurality of GAM7162 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7162 RNA, herein designated GAM RNA, and which when bound by GAM7162 RNA causes inhibition of translation of the GAM7162 target mRNA into a corresponding GAM7162 target protein.

The mechanism of the translational inhibition exerted by GAM7162 RNA, herein designated GAM RNA, on one or more GAM7162 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7162 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7162 RNA, herein designated GAM RNA, of GAM7162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7162 target RNA, herein designated GAM

TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7162 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7162 RNA correlate with, and may be deduced from, the identity of the GAM7162 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7169 RNA correlate with, and may be deduced from, the identity of the GAM7169 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7199 6724 GGATTTGGCA AAGAAGGCAG TACAGTTAAT CCTGGCTGCA ACTGCTGGAA AATTTGCTAC ACCC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7199 (GAM7199) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM7199 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM7199 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM7199 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7199 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7199 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7199 precursor RNA is designated SEQ ID:6724, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6724 is located from position 48078880 to position 48078943 relative to chromosome 13 on the `-` strand.

GAM7199 precursor RNA folds onto itself, forming GAM7199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7199 precursor RNA, designated SEQ ID NO: 6724, and a schematic representation of a predicted secondary folding of GAM7199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7199 folded precursor RNA yielding a GAM7199 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7199 RNA, hereby incorporated herein.

GAM7199 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7199 target RNA, herein designated GAM TARGET RNA. GAM7199 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7199 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7199 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7199 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7199 RNA, herein designated GAM RNA, to target binding sites on GAM7199 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7199 target RNA into GAM7199 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7199 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7199 target genes. The mRNA of each one of this plurality of GAM7199 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7199 RNA, herein designated GAM RNA, and which when bound by GAM7199 RNA causes inhibition of translation of the GAM7199 target mRNA into a corresponding GAM7199 target protein.

The mechanism of the translational inhibition exerted by GAM7199 RNA, herein designated GAM RNA, on one or more GAM7199 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7199 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7199 RNA, herein designated GAM RNA, of GAM7199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7199 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7199 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7199 RNA correlate with, and may be deduced from, the identity of the GAM7199 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7201 (GAM7201) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM7201 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM7201 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM7201 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7201 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7201 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7201 precursor RNA is designated SEQ ID:5704, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5704 is located from position 27583817 to position 27583894 relative to chromosome 17 on the `+` strand.

GAM7201 precursor RNA folds onto itself, forming GAM7201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7201 precursor RNA, designated SEQ ID NO: 5704, and a schematic representation of a predicted secondary folding of GAM7201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7201 folded precursor RNA yielding a GAM7201 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7201 RNA, hereby incorporated herein.

GAM7201 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7201 target RNA, herein designated GAM TARGET RNA. GAM7201 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7201 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7201 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7201 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7201 RNA, herein designated GAM RNA, to target binding sites on GAM7201 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7201 target RNA into GAM7201 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7201 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7201 target genes. The mRNA of each one of this plurality of GAM7201 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7201 RNA, herein

designated GAM RNA, and which when bound by GAM7201 RNA causes inhibition of translation of the GAM7201 target mRNA into a corresponding GAM7201 target protein.

The mechanism of the translational inhibition exerted by GAM7201 RNA, herein designated GAM RNA, on one or more GAM7201 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7201 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7201 RNA, herein designated GAM RNA, of GAM7201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7201 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7201 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7201 RNA correlate with, and may be deduced from, the identity of the GAM7201 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7212 (GAM7212) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM7212 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM7212 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM7212 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7212

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7212

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7212 precursor RNA is designated SEQ ID:6746, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6746 is located from position 45164402 to position 45164486 relative to chromosome 21 on the `-` strand.

GAM7212 precursor RNA folds onto itself, forming GAM7212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7212 precursor RNA, designated SEQ ID NO: 6746, and a schematic representation of a predicted secondary folding of GAM7212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7212 folded precursor RNA yielding a GAM7212 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7212 RNA, hereby incorporated herein.

GAM7212 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7212 target RNA, herein designated GAM TARGET RNA. GAM7212 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7212 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7212 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7212 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7212 RNA, herein designated GAM RNA, to target binding sites on GAM7212 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7212 target RNA into GAM7212 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7212 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7212 target genes. The mRNA of each one of this plurality of GAM7212 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7212 RNA, herein designated GAM RNA, and which when bound by GAM7212 RNA causes inhibition of translation of the GAM7212 target mRNA into a corresponding GAM7212 target protein.

The mechanism of the translational inhibition exerted by GAM7212 RNA, herein designated GAM RNA, on one or more GAM7212 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7212 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7212 RNA, herein designated GAM RNA, of GAM7212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7212 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7212 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7212 RNA correlate with, and may be deduced from, the identity of the GAM7212 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7241 5965 ATGACTGTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCAGGAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCTCAGTGT Messenger 7241 (GAM7241) oligonucleotides modulates expression of respective target genes

GAAGAACTAC whose function and utility is known in the art.

GGGTTTCCTG GAM7241 is a novel bioinformatically detectable regulatory, non protein coding,

ATGTTGAAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7241 was detected is

TCAGAATTAG described with additional reference to Figs. 9-15.

CCACACTGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTTCTCAGTC encoded by the human genome.

ATGCAT GAM7241 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7241 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7241 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7241 precursor RNA is designated SEQ ID:5965, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5965 is located from position 46762982 to position 46763077 relative to chromosome 12 on the `-` strand.

GAM7241 precursor RNA folds onto itself, forming GAM7241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7241 precursor RNA, designated SEQ ID NO: 5965, and a schematic representation of a predicted secondary folding of GAM7241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7241 folded precursor RNA yielding a GAM7241 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7241 RNA, hereby incorporated herein.

GAM7241 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7241 target RNA, herein designated GAM TARGET RNA. GAM7241 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7241 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7241 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7241 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7241 RNA, herein designated GAM RNA, to target binding sites on GAM7241 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7241 target RNA into GAM7241 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7241 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7241 target genes. The mRNA of each one of this plurality of GAM7241 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7241 RNA, herein designated GAM RNA, and which when bound by GAM7241 RNA causes inhibition of translation of the GAM7241 target mRNA into a corresponding GAM7241 target protein.

The mechanism of the translational inhibition exerted by GAM7241 RNA, herein designated GAM RNA, on one or more GAM7241 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7241 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7241 RNA, herein designated GAM RNA, of GAM7241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7241 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7241 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7241 RNA correlate with, and may be deduced from, the identity of the GAM7241 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTTGAAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTCTTCCAA encoded by the human genome.

ATTTGTCTTC GAM7255 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7255

TGAAAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7255

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7255 precursor RNA is designated SEQ ID:6273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6273 is located from position 33981298 to position 33981403 relative to chromosome 15 on the `+` strand.

GAM7255 precursor RNA folds onto itself, forming GAM7255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7255 precursor RNA, designated SEQ ID NO: 6273, and a schematic representation of a predicted secondary folding of GAM7255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7255 folded precursor RNA yielding a GAM7255 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7255 RNA, hereby incorporated herein.

GAM7255 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7255 target RNA, herein designated GAM TARGET RNA. GAM7255 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7255 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7255 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7255 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7255 RNA, herein designated GAM RNA, to target binding sites on GAM7255 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7255 target RNA into GAM7255 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7255 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7255 target genes. The mRNA of each one of this plurality of GAM7255 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7255 RNA, herein designated GAM RNA, and which when bound by GAM7255 RNA causes inhibition of translation of the GAM7255 target mRNA into a corresponding GAM7255 target protein.

The mechanism of the translational inhibition exerted by GAM7255 RNA, herein designated GAM RNA, on one or more GAM7255 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7255 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7255 RNA, herein designated GAM RNA, of GAM7255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7255 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7255 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7255 RNA correlate with, and may be deduced from, the identity of the GAM7255 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7257 6863 GTAGAGGTGG Fig. 8 further provides a conceptual description of another novel bioinformatically
GGTTTCTCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTTGGTCAG Messenger 7257 (GAM7257) oligonucleotides modulates expression of respective target genes
GCTGGTCTTT whose function and utility is known in the art.

AACTCCTGAC GAM7257 is a novel bioinformatically detectable regulatory, non protein coding,
CTCAGGTGAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7257 was detected is

ACGCCCGCCT described with additional reference to Figs. 9-15.

TGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM7257 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7257

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7257
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7257 precursor RNA is designated SEQ ID:6863, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6863 is located from position 159922811 to position 159922884 relative to chromosome 6 on the `-` strand.

GAM7257 precursor RNA folds onto itself, forming GAM7257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7257 precursor RNA, designated SEQ ID NO: 6863, and a schematic representation of a predicted secondary folding of GAM7257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7257 folded precursor RNA yielding a GAM7257 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7257 RNA, hereby incorporated herein.

GAM7257 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7257 target RNA, herein designated GAM TARGET RNA. GAM7257 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7257 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7257 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7257 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7257 RNA, herein designated GAM RNA, to target binding sites on GAM7257 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7257 target RNA into GAM7257 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7257 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7257 target genes. The mRNA of each one of this plurality of GAM7257 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7257 RNA, herein designated GAM RNA, and which when bound by GAM7257 RNA causes inhibition of translation of the GAM7257 target mRNA into a corresponding GAM7257 target protein.

The mechanism of the translational inhibition exerted by GAM7257 RNA, herein designated GAM RNA, on one or more GAM7257 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7257 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7257 RNA, herein designated GAM RNA, of GAM7257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7257 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7257 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7257 RNA correlate with, and may be deduced from, the identity of the GAM7257 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7260 6193 CTGAATCATG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTGTATAC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGATGTCAG Messenger 7260 (GAM7260) oligonucleotides modulates expression of respective target genes

TGAAGAGGTC whose function and utility is known in the art.

TGGCAGGAAT GAM7260 is a novel bioinformatically detectable regulatory, non protein coding,

GCCTCACTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7260 was detected is

CTTCCTACTG described with additional reference to Figs. 9-15.

ACTGGTACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTTATGATGC encoded by the human genome.

AG GAM7260 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7260

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7260

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7260 precursor RNA is designated SEQ ID:6193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6193 is located from position 61858740 to position 61858831 relative to chromosome X on the `+` strand.

GAM7260 precursor RNA folds onto itself, forming GAM7260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7260 precursor RNA, designated SEQ ID NO: 6193, and a schematic representation of a predicted secondary folding of GAM7260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7260 folded precursor RNA yielding a GAM7260 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7260 RNA, hereby incorporated herein.

GAM7260 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7260 target RNA, herein designated GAM TARGET RNA. GAM7260 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7260 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7260 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7260 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7260 RNA, herein designated GAM RNA, to target binding sites on GAM7260 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7260 target RNA into GAM7260 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7260 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7260 target genes. The mRNA of each one of this plurality of GAM7260 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7260 RNA, herein designated GAM RNA, and which when bound by GAM7260 RNA causes inhibition of translation of the GAM7260 target mRNA into a corresponding GAM7260 target protein.

The mechanism of the translational inhibition exerted by GAM7260 RNA, herein designated GAM RNA, on one or more GAM7260 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7260 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7260 RNA, herein designated GAM RNA, of GAM7260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM7260 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7260 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7260 RNA correlate with, and may be deduced from, the identity of the GAM7260 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7264 6552 GCTGTCTATT Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGAGTCTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGGCACAGA Messenger 7264 (GAM7264) oligonucleotides modulates expression of respective target genes
CATCTGTCAA whose function and utility is known in the art.

GGAAGAAGGA GAM7264 is a novel bioinformatically detectable regulatory, non protein coding,
TTCTTTGAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7264 was detected is

GTATTTGTGT described with additional reference to Figs. 9-15.

CAGTCAACTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CATATATGGA encoded by the human genome.

CCACAACAGA GAM7264 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7264
AAGC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7264

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7264 precursor RNA is designated SEQ ID:6552, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6552 is located from position 78654885 to position 78654988 relative to chromosome 11 on the `-` strand.

GAM7264 precursor RNA folds onto itself, forming GAM7264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7264 precursor RNA, designated SEQ ID NO: 6552, and a schematic representation of a predicted secondary folding of GAM7264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7264 folded precursor RNA yielding a GAM7264 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7264 RNA, hereby incorporated herein.

GAM7264 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7264 target RNA, herein designated GAM TARGET RNA. GAM7264 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7264 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7264 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7264 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7264 RNA, herein designated GAM RNA, to target binding sites on GAM7264 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7264 target RNA into GAM7264 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7264 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7264 target genes. The mRNA of each one of this plurality of GAM7264 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7264 RNA, herein designated GAM RNA, and which when bound by GAM7264 RNA causes inhibition of translation of the GAM7264 target mRNA into a corresponding GAM7264 target protein.

The mechanism of the translational inhibition exerted by GAM7264 RNA, herein designated GAM RNA, on one or more GAM7264 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7264 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7264 RNA, herein designated GAM RNA, of

GAM7264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7264 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7264 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7264 RNA correlate with, and may be deduced from, the identity of the GAM7264 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACAAAGCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCAGGATAG Messenger 7272 (GAM7272) oligonucleotides modulates expression of respective target genes

CCCTGGGCAG whose function and utility is known in the art.

AACTCCTGGG GAM7272 is a novel bioinformatically detectable regulatory, non protein coding,

ATTGACTGGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7272 was detected is

CAGTAATGTA described with additional reference to Figs. 9-15.

GTTGAGAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7272 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7272

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7272

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7272 precursor RNA is designated SEQ ID:6095, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6095 is located from position 44585164 to position 44585243 relative to chromosome 20 on the `+` strand.

GAM7272 precursor RNA folds onto itself, forming GAM7272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7272 precursor RNA, designated SEQ ID NO: 6095, and a schematic representation of a predicted secondary folding of GAM7272 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7272 folded precursor RNA yielding a GAM7272 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7272 RNA, hereby incorporated herein.

GAM7272 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7272 target RNA, herein designated GAM TARGET RNA. GAM7272 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7272 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7272 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7272 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7272 RNA, herein designated GAM RNA, to target binding sites on GAM7272 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7272 target RNA into GAM7272 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7272 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7272 target genes. The mRNA of each one of this plurality of GAM7272 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7272 RNA, herein designated GAM RNA, and which when bound by GAM7272 RNA causes inhibition of translation of the GAM7272 target mRNA into a corresponding GAM7272 target protein.

The mechanism of the translational inhibition exerted by GAM7272 RNA, herein designated GAM RNA, on one or more GAM7272 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7272 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM7272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7272 RNA, herein designated GAM RNA, of GAM7272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7272 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7272 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7272 RNA correlate with, and may be deduced from, the identity of the GAM7272 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7302 6114 CCTCCTGTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCAAAACGA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAACACTCCT Messenger 7302 (GAM7302) oligonucleotides modulates expression of respective target genes

ATATTTTGTA whose function and utility is known in the art.

GCGCCTTCCA GAM7302 is a novel bioinformatically detectable regulatory, non protein coding,

GAATGGGGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7302 was detected is

GCGGAAACTA described with additional reference to Figs. 9-15.

GTGTTGGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAAGGAGG encoded by the human genome.

GAM7302 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7302

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7302

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7302 precursor RNA is designated SEQ ID:6114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6114 is located from position 53161341 to position 53161428 relative to chromosome 15 on the `-` strand.

GAM7302 precursor RNA folds onto itself, forming GAM7302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7302 precursor RNA, designated SEQ ID NO: 6114, and a schematic representation of a predicted secondary folding of GAM7302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7302 folded precursor RNA yielding a GAM7302 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7302 RNA, hereby incorporated herein.

GAM7302 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7302 target RNA, herein designated GAM TARGET RNA. GAM7302 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7302 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7302 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7302 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7302 RNA, herein designated GAM RNA, to target binding sites on GAM7302 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7302 target RNA into GAM7302 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7302 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7302 target genes. The mRNA of each one of this plurality of GAM7302 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7302 RNA, herein designated GAM RNA, and which when bound by GAM7302 RNA causes inhibition of translation of the GAM7302 target mRNA into a corresponding GAM7302 target protein.

The mechanism of the translational inhibition exerted by GAM7302 RNA, herein designated GAM RNA, on one or more GAM7302 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7302 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7302 RNA, herein designated GAM RNA, of GAM7302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7302 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7302 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7302 RNA correlate with, and may be deduced from, the identity of the GAM7302 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTCCAATGTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7320 was detected is

TGGGGACACT described with additional reference to Figs. 9-15.

TTTGGTTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM7320 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7320

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7320

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7320 precursor RNA is designated SEQ ID:6185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6185 is located from position 69298330 to position 69298411 relative to chromosome 5 on the `-` strand.

GAM7320 precursor RNA folds onto itself, forming GAM7320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7320 precursor RNA, designated SEQ ID NO: 6185, and a schematic representation of a predicted secondary folding of GAM7320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7320 folded precursor RNA yielding a GAM7320 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7320 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7320 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7320 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7320 target RNA, herein designated GAM TARGET RNA. GAM7320 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7320 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7320 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7320 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7320 RNA, herein designated GAM RNA, to target binding sites on GAM7320 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7320 target RNA into GAM7320 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7320 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7320 target genes. The mRNA of each one of this plurality of GAM7320 target genes comprises one or more target binding sites, each having

a nucleotide sequence which is at least partly complementary to GAM7320 RNA, herein designated GAM RNA, and which when bound by GAM7320 RNA causes inhibition of translation of the GAM7320 target mRNA into a corresponding GAM7320 target protein.

The mechanism of the translational inhibition exerted by GAM7320 RNA, herein designated GAM RNA, on one or more GAM7320 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7320 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7320 RNA, herein designated GAM RNA, of GAM7320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7320 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7320 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7320 RNA correlate with, and may be deduced from, the identity of the GAM7320 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7331 6452 GAGGTAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AACTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTCAGGAGG Messenger 7331 (GAM7331) oligonucleotides modulates expression of respective target genes
CGGGGGCTGC whose function and utility is known in the art.

AATGAGCTGA GAM7331 is a novel bioinformatically detectable regulatory, non protein coding,
GATCAAGCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7331 was detected is

CTGCACTCCA described with additional reference to Figs. 9-15.

GCCTATGGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TAGAGTGAGA encoded by the human genome.

TTCCATCTC GAM7331 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7331
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7331

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7331 precursor RNA is designated SEQ ID:6452, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6452 is located from position 61512957 to position 61513055 relative to chromosome 20 on the `+` strand.

GAM7331 precursor RNA folds onto itself, forming GAM7331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7331 precursor RNA, designated SEQ ID NO: 6452, and a schematic representation of a predicted secondary folding of GAM7331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7331 folded precursor RNA yielding a GAM7331 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7331 RNA, hereby incorporated herein.

GAM7331 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7331 target RNA, herein designated GAM TARGET RNA. GAM7331 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7331 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7331 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7331 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7331 RNA, herein designated GAM RNA, to target binding sites on GAM7331 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7331 target RNA into GAM7331 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7331 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7331 target genes. The mRNA of each one of this plurality of GAM7331 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7331 RNA, herein designated GAM RNA, and which when bound by GAM7331 RNA causes inhibition of translation of the GAM7331 target mRNA into a corresponding GAM7331 target protein.

The mechanism of the translational inhibition exerted by GAM7331 RNA, herein designated GAM RNA, on one or more GAM7331 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7331 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7331 RNA, herein designated GAM RNA, of GAM7331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7331 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7331 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7331 RNA correlate with, and may be deduced from, the identity of the GAM7331 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7345 6300 GAATAAATAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCCAAGAA Messenger 7345 (GAM7345) oligonucleotides modulates expression of respective target genes

TTCACATGTG whose function and utility is known in the art.

GTTGTATGCA GAM7345 is a novel bioinformatically detectable regulatory, non protein coding,

GCTTTACTGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7345 was detected is

GAGACTGAAG described with additional reference to Figs. 9-15.

TGTATCTGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTGATTCTG encoded by the human genome.

CTGTGATGGA GAM7345 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7345

CACTTGTAAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7345

TTT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7345 precursor RNA is designated SEQ ID:6300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6300 is located from position 62131103 to position 62131215 relative to chromosome 9 on the `-` strand.

GAM7345 precursor RNA folds onto itself, forming GAM7345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7345 precursor RNA, designated SEQ ID NO: 6300, and a schematic representation of a predicted secondary folding of GAM7345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7345 folded precursor RNA yielding a GAM7345 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7345 RNA, hereby incorporated herein.

GAM7345 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7345 target RNA, herein designated GAM TARGET RNA. GAM7345 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7345 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7345 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7345 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7345 RNA, herein designated GAM RNA, to target binding sites on GAM7345 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7345 target RNA into GAM7345 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7345 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7345 target genes. The mRNA of each one of this plurality of GAM7345 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7345 RNA, herein designated GAM RNA, and which when bound by GAM7345 RNA causes inhibition of translation of the GAM7345 target mRNA into a corresponding GAM7345 target protein.

The mechanism of the translational inhibition exerted by GAM7345 RNA, herein designated GAM RNA, on one or more GAM7345 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7345 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7345 RNA, herein designated GAM RNA, of GAM7345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7345 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7345 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7345 RNA correlate with, and may be deduced from, the identity of the GAM7345 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGCTTCTTA Messenger 7349 (GAM7349) oligonucleotides modulates expression of respective target genes

AGATGTTGTT whose function and utility is known in the art.

ACAATAATCT GAM7349 is a novel bioinformatically detectable regulatory, non protein coding,

ACTATGTGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7349 was detected is

GTGTCTGGAG described with additional reference to Figs. 9-15.

GTGTCTCTTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTTCTCTGGC encoded by the human genome.

ATTAAGAGAC GAM7349 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7349

AG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7349

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7349 precursor RNA is designated SEQ ID:6240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6240 is located from position 43372332 to position 43372433 relative to chromosome 12 on the `-` strand.

GAM7349 precursor RNA folds onto itself, forming GAM7349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7349 precursor RNA, designated SEQ ID NO: 6240, and a schematic representation of a predicted secondary folding of GAM7349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7349 folded precursor RNA yielding a GAM7349 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7349 RNA, hereby incorporated herein.

GAM7349 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7349 target RNA, herein designated GAM TARGET RNA. GAM7349 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7349 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7349 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7349 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7349 RNA, herein designated GAM RNA, to target binding sites on GAM7349 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7349 target RNA into GAM7349 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7349 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7349 target genes. The mRNA of each one of this plurality of GAM7349 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7349 RNA, herein designated GAM RNA, and which when bound by GAM7349 RNA causes inhibition of translation of the GAM7349 target mRNA into a corresponding GAM7349 target protein.

The mechanism of the translational inhibition exerted by GAM7349 RNA, herein designated GAM RNA, on one or more GAM7349 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7349 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7349 RNA, herein designated GAM RNA, of GAM7349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7349 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7349 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7349 RNA correlate with, and may be deduced from, the identity of the GAM7349 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCAGCAAGGA described with additional reference to Figs. 9-15.

GGGGTGGACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATGAAACTGG encoded by the human genome.

GTTCAGCTTG GAM7363 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7363
ATTTGTT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7363

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7363 precursor RNA is designated SEQ ID:5741, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5741 is located from position 97689215 to position 97689321 relative to chromosome 9 on the `+` strand.

GAM7363 precursor RNA folds onto itself, forming GAM7363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7363 precursor RNA, designated SEQ ID NO: 5741, and a schematic representation of a predicted secondary folding of GAM7363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7363 folded precursor RNA yielding a GAM7363 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7363 RNA, hereby incorporated herein.

GAM7363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7363 target RNA, herein designated GAM TARGET RNA. GAM7363 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7363 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7363 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7363 RNA, herein designated GAM RNA, to target binding sites on GAM7363 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7363 target RNA into GAM7363 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7363 target genes. The mRNA of each one of this plurality of GAM7363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7363 RNA, herein designated GAM RNA, and which when bound by GAM7363 RNA causes inhibition of translation of the GAM7363 target mRNA into a corresponding GAM7363 target protein.

The mechanism of the translational inhibition exerted by GAM7363 RNA, herein designated GAM RNA, on one or more GAM7363 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7363 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7363 RNA, herein designated GAM RNA, of GAM7363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7363 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7363 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7363 RNA correlate with, and may be deduced from, the identity of the GAM7363 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7366 6690 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGGCGGAGG Messenger 7366 (GAM7366) oligonucleotides modulates expression of respective target genes

TTGTGGTGAG whose function and utility is known in the art.

TGAAGATTGC GAM7366 is a novel bioinformatically detectable regulatory, non protein coding,

ACTATTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7366 was detected is

TCCAGCCTGG described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAAACTCC encoded by the human genome.

GAM7366 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7366

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7366

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7366 precursor RNA is designated SEQ ID:6690, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6690 is located from position 49033585 to position 49033673 relative to chromosome 12 on the `+` strand.

GAM7366 precursor RNA folds onto itself, forming GAM7366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7366 precursor RNA, designated SEQ ID NO: 6690, and a schematic representation of a predicted secondary folding of GAM7366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7366 folded precursor RNA yielding a GAM7366 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7366 RNA, hereby incorporated herein.

GAM7366 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7366 target RNA, herein designated GAM TARGET RNA. GAM7366 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7366 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7366 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7366 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7366 RNA, herein designated GAM RNA, to target binding sites on GAM7366 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7366 target RNA into GAM7366 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7366 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7366 target genes. The mRNA of each one of this plurality of GAM7366 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7366 RNA, herein designated GAM RNA, and which when bound by GAM7366 RNA causes inhibition of translation of the GAM7366 target mRNA into a corresponding GAM7366 target protein.

The mechanism of the translational inhibition exerted by GAM7366 RNA, herein designated GAM RNA, on one or more GAM7366 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7366 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7366 RNA, herein designated GAM RNA, of GAM7366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM7366 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7366 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7366 RNA correlate with, and may be deduced from, the identity of the GAM7366 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7369 7065 TCTCTCTTCC Fig. 8 further provides a conceptual description of another novel bioinformatically
CTCTCATCAT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGATTAATCA Messenger 7369 (GAM7369) oligonucleotides modulates expression of respective target genes
CTTAGTTGCA whose function and utility is known in the art.

AGGGACCAGT GAM7369 is a novel bioinformatically detectable regulatory, non protein coding,
AAATTAACAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7369 was detected is

AATGGTGAAC described with additional reference to Figs. 9-15.

ATTTTCCTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTTGGTGCT encoded by the human genome.

TTTGCTGGAT GAM7369 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7369
GACTAGTGGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7369
TTCTGCTGGA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
ACAGAGA to the nucleotide sequence of GAM7369 precursor RNA is designated SEQ ID:7065, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7065 is located from position 26088279 to position 26088405 relative to chromosome 13 on the `+` strand.

GAM7369 precursor RNA folds onto itself, forming GAM7369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7369 precursor RNA, designated SEQ ID NO: 7065, and a schematic representation of a predicted secondary folding of GAM7369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7369 folded precursor RNA

yielding a GAM7369 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7369 RNA, hereby incorporated herein.

GAM7369 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7369 target RNA, herein designated GAM TARGET RNA. GAM7369 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7369 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7369 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7369 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7369 RNA, herein designated GAM RNA, to target binding sites on GAM7369 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7369 target RNA into GAM7369 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7369 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7369 target genes. The mRNA of each one of this plurality of GAM7369 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7369 RNA, herein designated GAM RNA, and which when bound by GAM7369 RNA causes inhibition of translation of the GAM7369 target mRNA into a corresponding GAM7369 target protein.

The mechanism of the translational inhibition exerted by GAM7369 RNA, herein designated GAM RNA, on one or more GAM7369 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7369 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7369 RNA, herein designated GAM RNA, of GAM7369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7369 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7369 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7369 RNA correlate with, and may be deduced from, the identity of the GAM7369 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7371 6773 GGGAAAGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGAGGTCT Messenger 7371 (GAM7371) oligonucleotides modulates expression of respective target genes

GCTGGCAGGC whose function and utility is known in the art.

AGGCAGACAT GAM7371 is a novel bioinformatically detectable regulatory, non protein coding,

TTGGAGCCAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7371 was detected is

CTTTCCTGCT described with additional reference to Figs. 9-15.

CAGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7371 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7371

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7371

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7371 precursor RNA is designated SEQ ID:6773, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6773 is located from position 127634676 to position 127634751 relative to chromosome 7 on the `-` strand.

GAM7371 precursor RNA folds onto itself, forming GAM7371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7371 precursor RNA, designated SEQ ID NO: 6773, and a

schematic representation of a predicted secondary folding of GAM7371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7371 folded precursor RNA yielding a GAM7371 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7371 RNA, hereby incorporated herein.

GAM7371 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7371 target RNA, herein designated GAM TARGET RNA. GAM7371 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7371 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7371 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7371 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7371 RNA, herein designated GAM RNA, to target binding sites on GAM7371 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7371 target RNA into GAM7371 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7371 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7371 target genes. The mRNA of each one of this plurality of GAM7371 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7371 RNA, herein designated GAM RNA, and which when bound by GAM7371 RNA causes inhibition of translation of the GAM7371 target mRNA into a corresponding GAM7371 target protein.

The mechanism of the translational inhibition exerted by GAM7371 RNA, herein designated GAM RNA, on one or more GAM7371 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7371 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7371 RNA, herein designated GAM RNA, of GAM7371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7371 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7371 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7371 RNA correlate with, and may be deduced from, the identity of the GAM7371 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7374 6111 CCTCATTGGT Fig. 8 further provides a conceptual description of another novel bioinformatically
TCATTCGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTGTTTATT Messenger 7374 (GAM7374) oligonucleotides modulates expression of respective target genes
TAGAACCTGC whose function and utility is known in the art.

CGTGTGCTAG GAM7374 is a novel bioinformatically detectable regulatory, non protein coding,
GGCAGATCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7374 was detected is

GGATACAGCT described with additional reference to Figs. 9-15.

GTGGACAAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGGATGAGG encoded by the human genome.

GAM7374 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7374

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7374

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7374 precursor RNA is designated SEQ ID:6111, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6111 is located from position 36127247 to position 36127336 relative to chromosome 20 on the `-` strand.

GAM7374 precursor RNA folds onto itself, forming GAM7374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7374 precursor RNA, designated SEQ ID NO: 6111, and a schematic representation of a predicted secondary folding of GAM7374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7374 folded precursor RNA yielding a GAM7374 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7374 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7374 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7374 target RNA, herein designated GAM TARGET RNA. GAM7374 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7374 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7374 RNA, herein designated GAM RNA, to target binding sites on GAM7374 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7374 target RNA into GAM7374 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7374 target genes. The mRNA of each one of this plurality of GAM7374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7374 RNA, herein designated GAM RNA, and which when bound by GAM7374 RNA causes inhibition of translation of the GAM7374 target mRNA into a corresponding GAM7374 target protein.

The mechanism of the translational inhibition exerted by GAM7374 RNA, herein designated GAM RNA, on one or more GAM7374 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7374 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7374 RNA, herein designated GAM RNA, of GAM7374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7374 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7374 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7374 RNA correlate with, and may be deduced from, the identity of the GAM7374 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7400 6713 GGAGGGGAGG ATACAAGAGG AATGATAAAT GGCAAGGAAA ACCACTCACT CTTAATGCTT TTTGTCATAC TCATGTCCTC TTGTCC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7400 (GAM7400) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM7400 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM7400 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM7400 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7400 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7400 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7400 precursor RNA is designated SEQ ID:6713, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:6713 is located from position 92806795 to position 92806880 relative to chromosome 13 on the `+` strand.

GAM7400 precursor RNA folds onto itself, forming GAM7400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7400 precursor RNA, designated SEQ ID NO: 6713, and a schematic representation of a predicted secondary folding of GAM7400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7400 folded precursor RNA yielding a GAM7400 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7400 RNA, hereby incorporated herein.

GAM7400 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7400 target RNA, herein designated GAM TARGET RNA. GAM7400 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7400 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7400 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7400 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7400 RNA, herein designated GAM RNA, to target binding sites on GAM7400 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7400 target RNA into GAM7400 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7400 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7400 target genes. The mRNA of each one of this

plurality of GAM7400 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7400 RNA, herein designated GAM RNA, and which when bound by GAM7400 RNA causes inhibition of translation of the GAM7400 target mRNA into a corresponding GAM7400 target protein.

The mechanism of the translational inhibition exerted by GAM7400 RNA, herein designated GAM RNA, on one or more GAM7400 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7400 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7400 RNA, herein designated GAM RNA, of GAM7400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7400 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7400 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7400 RNA correlate with, and may be deduced from, the identity of the GAM7400 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7415 6061 CCATCTTCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
TGGCATTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCTTGGCTGG Messenger 7415 (GAM7415) oligonucleotides modulates expression of respective target genes
GATGCTGAGT whose function and utility is known in the art.

TATCCACTGG GAM7415 is a novel bioinformatically detectable regulatory, non protein coding,
AGCATCGGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7415 was detected is

GTACAGGCAG described with additional reference to Figs. 9-15.

GCACAGAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGTGGATCCA encoded by the human genome.

TCGGAGGTGG GAM7415 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7415

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7415

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7415 precursor RNA is designated SEQ ID:6061, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6061 is located from position 69762453 to position 69762552 relative to chromosome 16 on the `+` strand.

GAM7415 precursor RNA folds onto itself, forming GAM7415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7415 precursor RNA, designated SEQ ID NO: 6061, and a schematic representation of a predicted secondary folding of GAM7415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7415 folded precursor RNA yielding a GAM7415 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7415 RNA, hereby incorporated herein.

GAM7415 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7415 target RNA, herein designated GAM TARGET RNA. GAM7415 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7415 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7415 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7415 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7415 RNA, herein designated GAM RNA, to target binding sites on GAM7415 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7415 target RNA

into GAM7415 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7415 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7415 target genes. The mRNA of each one of this plurality of GAM7415 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7415 RNA, herein designated GAM RNA, and which when bound by GAM7415 RNA causes inhibition of translation of the GAM7415 target mRNA into a corresponding GAM7415 target protein.

The mechanism of the translational inhibition exerted by GAM7415 RNA, herein designated GAM RNA, on one or more GAM7415 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7415 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7415 RNA, herein designated GAM RNA, of GAM7415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7415 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7415 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7415 RNA correlate with, and may be deduced from, the identity of the GAM7415 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7440 6162 CTCAGGTCCT Fig. 8 further provides a conceptual description of another novel bioinformatically
TTAGTGCTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCAGTCAACA Messenger 7440 (GAM7440) oligonucleotides modulates expression of respective target genes
GACAGGGAGG whose function and utility is known in the art.

GAGCTTCCCC GAM7440 is a novel bioinformatically detectable regulatory, non protein coding,
TGTGACTGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7440 was detected is

GTGCGCATAA described with additional reference to Figs. 9-15.

AGACTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7440 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7440 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7440 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7440 precursor RNA is designated SEQ ID:6162, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6162 is located from position 42307485 to position 42307562 relative to chromosome 21 on the `-` strand.

GAM7440 precursor RNA folds onto itself, forming GAM7440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7440 precursor RNA, designated SEQ ID NO: 6162, and a schematic representation of a predicted secondary folding of GAM7440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7440 folded precursor RNA yielding a GAM7440 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7440 RNA, hereby incorporated herein.

GAM7440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7440 target RNA, herein designated GAM TARGET RNA. GAM7440 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7440 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7440 RNA, herein designated GAM RNA, to target binding sites on GAM7440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7440 target RNA into GAM7440 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7440 target genes. The mRNA of each one of this plurality of GAM7440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7440 RNA, herein designated GAM RNA, and which when bound by GAM7440 RNA causes inhibition of translation of the GAM7440 target mRNA into a corresponding GAM7440 target protein.

The mechanism of the translational inhibition exerted by GAM7440 RNA, herein designated GAM RNA, on one or more GAM7440 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7440 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7440 RNA, herein designated GAM RNA, of GAM7440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7440 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7440 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7440 RNA correlate with, and may be deduced from, the identity of the GAM7440 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7446 5735 AGAGTCTCAT Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTGTTGCCC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGCAGGAGT Messenger 7446 (GAM7446) oligonucleotides modulates expression of respective target genes
GCAATGGTGT whose function and utility is known in the art.

GACCTCAGGT GAM7446 is a novel bioinformatically detectable regulatory, non protein coding,
CACTGCAACC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7446 was detected is

TCTGCTGCCT described with additional reference to Figs. 9-15.

GGGTTCAAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATTCT encoded by the human genome.

GAM7446 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7446 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7446 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7446 precursor RNA is designated SEQ ID:5735, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5735 is located from position 45848125 to position 45848210 relative to chromosome 19 on the `+` strand.

GAM7446 precursor RNA folds onto itself, forming GAM7446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7446 precursor RNA, designated SEQ ID NO: 5735, and a schematic representation of a predicted secondary folding of GAM7446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7446 folded precursor RNA yielding a GAM7446 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7446 RNA, hereby incorporated herein. Expression of GAM7446 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7446 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7446 target RNA, herein designated GAM TARGET RNA. GAM7446 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7446 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7446 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7446 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7446 RNA, herein designated GAM RNA, to target binding sites on GAM7446 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7446 target RNA into GAM7446 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7446 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7446 target genes. The mRNA of each one of this plurality of GAM7446 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7446 RNA, herein designated GAM RNA, and which when bound by GAM7446 RNA causes inhibition of translation of the GAM7446 target mRNA into a corresponding GAM7446 target protein.

The mechanism of the translational inhibition exerted by GAM7446 RNA, herein designated GAM RNA, on one or more GAM7446 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7446 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7446 RNA, herein designated GAM RNA, of GAM7446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7446 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7446 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7446 RNA correlate with, and may be deduced from, the identity of the GAM7446 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7449 7217 TGGAGACTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGCTTATTA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAGAAACTCC Messenger 7449 (GAM7449) oligonucleotides modulates expression of respective target genes

GTGTTACTCA whose function and utility is known in the art.

TTCCTGGAGT GAM7449 is a novel bioinformatically detectable regulatory, non protein coding, TGGGGGTTTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7449 was detected is

TGTAGGCACT described with additional reference to Figs. 9-15.

TTATTTCTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

A encoded by the human genome.

GAM7449 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7449

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7449

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7449 precursor RNA is designated SEQ ID:7217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7217 is located from position 26847818 to position 26847898 relative to chromosome 7 on the `+` strand.

GAM7449 precursor RNA folds onto itself, forming GAM7449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7449 precursor RNA, designated SEQ ID NO: 7217, and a schematic representation of a predicted secondary folding of GAM7449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7449 folded precursor RNA yielding a GAM7449 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7449 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7449 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7449 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7449 target RNA, herein designated GAM TARGET RNA. GAM7449 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7449 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7449 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7449 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7449 RNA, herein designated GAM RNA, to target binding sites on GAM7449 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7449 target RNA into GAM7449 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7449 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7449 target genes. The mRNA of each one of this plurality of GAM7449 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7449 RNA, herein designated GAM RNA, and which when bound by GAM7449 RNA causes inhibition of translation of the GAM7449 target mRNA into a corresponding GAM7449 target protein.

The mechanism of the translational inhibition exerted by GAM7449 RNA, herein designated GAM RNA, on one or more GAM7449 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7449 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7449 RNA, herein designated GAM RNA, of GAM7449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7449 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7449 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7449 RNA correlate with, and may be deduced from, the identity of the GAM7449 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7464 6554 GCTTACAATT Fig. 8 further provides a conceptual description of another novel bioinformatically
GCTGGTACCT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGTAGCATTT Messenger 7464 (GAM7464) oligonucleotides modulates expression of respective target genes
ATTTTCCCTC whose function and utility is known in the art.

AAGTACCTAG GAM7464 is a novel bioinformatically detectable regulatory, non protein coding,
TAACCTTATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7464 was detected is

AAGGTAGGGA described with additional reference to Figs. 9-15.

GGGTAGATGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTACCACAT encoded by the human genome.

TCCTTCAGCT GAM7464 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7464
GTATTGAGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7464

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7464 precursor RNA is designated SEQ ID:6554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6554 is located from position 37872487 to position 37872595 relative to chromosome 8 on the `-` strand.

GAM7464 precursor RNA folds onto itself, forming GAM7464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7464 precursor RNA, designated SEQ ID NO: 6554, and a schematic representation of a predicted secondary folding of GAM7464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7464 folded precursor RNA yielding a GAM7464 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7464 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7464 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7464 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7464 target RNA, herein designated GAM TARGET RNA. GAM7464 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7464 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7464 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7464 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7464 RNA, herein designated GAM RNA, to target binding sites on GAM7464 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7464 target RNA into GAM7464 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7464 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7464 target genes. The mRNA of each one of this plurality of GAM7464 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7464 RNA, herein designated GAM RNA, and which when bound by GAM7464 RNA causes inhibition of translation of the GAM7464 target mRNA into a corresponding GAM7464 target protein.

The mechanism of the translational inhibition exerted by GAM7464 RNA, herein designated GAM RNA, on one or more GAM7464 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7464 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7464 RNA, herein designated GAM RNA, of GAM7464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7464 target RNA, herein designated GAM

TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7464 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7464 RNA correlate with, and may be deduced from, the identity of the GAM7464 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTCTCGGCAG Messenger 7473 (GAM7473) oligonucleotides modulates expression of respective target genes
GGAACAGGAA whose function and utility is known in the art.

GTAGGAATCC GAM7473 is a novel bioinformatically detectable regulatory, non protein coding,
CAGAAGGGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7473 was detected is

TGGGGGAACC described with additional reference to Figs. 9-15.

CTAACCCTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTCAGTCCA encoded by the human genome.

GTTCACCCCT GAM7473 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7473
CACCTCCAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7473
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7473 precursor RNA is designated SEQ ID:6223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6223 is located from position 3484360 to position 3484468 relative to chromosome 19 on the `-` strand.

GAM7473 precursor RNA folds onto itself, forming GAM7473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7473 precursor RNA, designated SEQ ID NO: 6223, and a schematic representation of a predicted secondary folding of GAM7473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7473 folded precursor RNA yielding a GAM7473 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor

product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7473 RNA, hereby incorporated herein. Expression of GAM7473 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7473 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7473 target RNA, herein designated GAM TARGET RNA. GAM7473 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7473 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7473 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7473 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7473 RNA, herein designated GAM RNA, to target binding sites on GAM7473 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7473 target RNA into GAM7473 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7473 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7473 target genes. The mRNA of each one of this plurality of GAM7473 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7473 RNA, herein designated GAM RNA, and which when bound by GAM7473 RNA causes inhibition of translation of the GAM7473 target mRNA into a corresponding GAM7473 target protein.

The mechanism of the translational inhibition exerted by GAM7473 RNA, herein designated GAM RNA, on one or more GAM7473 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7473 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7473 RNA, herein designated GAM RNA, of GAM7473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7473 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7473 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7473 RNA correlate with, and may be deduced from, the identity of the GAM7473 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7477 6017 CAGCGCGGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCGCCACCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAATAAATG Messenger 7477 (GAM7477) oligonucleotides modulates expression of respective target genes

TTGCTTGGAG whose function and utility is known in the art.

TGGACCGAGG GAM7477 is a novel bioinformatically detectable regulatory, non protein coding,

CTCTGCAGGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7477 was detected is

ATGCAGGGAG described with additional reference to Figs. 9-15.

GGCCGGGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGCCCCAGGG encoded by the human genome.

TTATTTCTAA GAM7477 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7477

GTTGAGGACA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7477

GGAGGTTGTG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

AGTTCTGCTG to the nucleotide sequence of GAM7477 precursor RNA is designated SEQ ID:6017, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6017 is located from position 72048231 to position 72048360 relative to chromosome 7 on the `+` strand.

GAM7477 precursor RNA folds onto itself, forming GAM7477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7477 precursor RNA, designated SEQ ID NO: 6017, and a schematic representation of a predicted secondary folding of GAM7477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7477 folded precursor RNA yielding a GAM7477 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7477 RNA, hereby incorporated herein.

GAM7477 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7477 target RNA, herein designated GAM TARGET RNA. GAM7477 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7477 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7477 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7477 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7477 RNA, herein designated GAM RNA, to target binding sites on GAM7477 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7477 target RNA into GAM7477 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7477 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7477 target genes. The mRNA of each one of this plurality of GAM7477 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7477 RNA, herein designated GAM RNA, and which when bound by GAM7477 RNA causes inhibition of translation of the GAM7477 target mRNA into a corresponding GAM7477 target protein.

The mechanism of the translational inhibition exerted by GAM7477 RNA, herein designated GAM RNA, on one or more GAM7477 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7477 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7477 RNA, herein designated GAM RNA, of GAM7477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7477 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7477 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7477 RNA correlate with, and may be deduced from, the identity of the GAM7477 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7520 6992 TCACCCTGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCTAGGCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GACGGAATGC Messenger 7520 (GAM7520) oligonucleotides modulates expression of respective target genes

AGTGAAGTCA whose function and utility is known in the art.

TCATAGTTTA GAM7520 is a novel bioinformatically detectable regulatory, non protein coding,

CTGTAACACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7520 was detected is

GAACTCCTGG described with additional reference to Figs. 9-15.

GCTCAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7520 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7520

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7520

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7520 precursor RNA is designated SEQ ID:6992, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6992 is located from position 42534098 to position 42534177 relative to chromosome 17 on the `+` strand.

GAM7520 precursor RNA folds onto itself, forming GAM7520 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7520 precursor RNA, designated SEQ ID NO: 6992, and a schematic representation of a predicted secondary folding of GAM7520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7520 folded precursor RNA yielding a GAM7520 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7520 RNA, hereby incorporated herein.

GAM7520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7520 target RNA, herein designated GAM TARGET RNA. GAM7520 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7520 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7520 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7520 RNA, herein designated GAM RNA, to target binding sites on GAM7520 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7520 target RNA into GAM7520 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7520 target genes. The mRNA of each one of this plurality of GAM7520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7520 RNA, herein designated GAM RNA, and which when bound by GAM7520 RNA causes inhibition of translation of the GAM7520 target mRNA into a corresponding GAM7520 target protein.

The mechanism of the translational inhibition exerted by GAM7520 RNA, herein designated GAM RNA, on one or more GAM7520 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7520 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7520 RNA, herein designated GAM RNA, of GAM7520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7520 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7520 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7520 RNA correlate with, and may be deduced from, the identity of the GAM7520 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7530 6557 GCTTCCTCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CACCTTGTGC detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTGCTGCTC Messenger 7530 (GAM7530) oligonucleotides modulates expression of respective target genes

CCACACCACA whose function and utility is known in the art.

GTGACTAGCA GAM7530 is a novel bioinformatically detectable regulatory, non protein coding,

GCACATAATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7530 was detected is

GTTTGAATTA described with additional reference to Figs. 9-15.

AAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7530 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7530

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7530

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7530 precursor RNA is designated SEQ ID:6557, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6557 is located from position 3260144 to position 3260217 relative to chromosome 7 on the `-` strand.

GAM7530 precursor RNA folds onto itself, forming GAM7530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

It is appreciated that specific functions, and accordingly utilities, of GAM7542 RNA correlate with, and may be deduced from, the identity of the GAM7542 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7546 6119 CCTGCTGTAT GCTAGGCATT GTGCAAGGTG TTAGGGCTGA TGCTTGAGCA CAGTACCTCC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7546 (GAM7546) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM7546 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM7546 was detected is

ACATCTGCAG described with additional reference to Figs. 9-15.

TATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM7546 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7546 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7546 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7546 precursor RNA is designated SEQ ID:6119, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6119 is located from position 60900963 to position 60901037 relative to chromosome 17 on the `+` strand.

GAM7546 precursor RNA folds onto itself, forming GAM7546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7546 precursor RNA, designated SEQ ID NO: 6119, and a schematic representation of a predicted secondary folding of GAM7546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7546 folded precursor RNA yielding a GAM7546 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7546 RNA, hereby incorporated herein.

GAM7546 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7546 target RNA, herein designated GAM TARGET RNA. GAM7546 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7546 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7546 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7546 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7546 RNA, herein designated GAM RNA, to target binding sites on GAM7546 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7546 target RNA into GAM7546 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7546 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7546 target genes. The mRNA of each one of this plurality of GAM7546 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7546 RNA, herein designated GAM RNA, and which when bound by GAM7546 RNA causes inhibition of translation of the GAM7546 target mRNA into a corresponding GAM7546 target protein.

The mechanism of the translational inhibition exerted by GAM7546 RNA, herein designated GAM RNA, on one or more GAM7546 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7546 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7546 RNA, herein designated GAM RNA, of GAM7546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7546 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7546 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7546 RNA correlate with, and may be deduced from, the identity of the GAM7546 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7553 5658 AACTGGTCGG TGATTTAGGT AGTTTCCTGT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 7553 (GAM7553) oligonucleotides modulates expression of respective target genes

TGTTGGGATC whose function and utility is known in the art.

CACCTTTCTC GAM7553 is a novel bioinformatically detectable regulatory, non protein coding, TCGACAGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7553 was detected is

GACACTGCCT described with additional reference to Figs. 9-15.

TCATTACTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTT encoded by the human genome.

GAM7553 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7553 precursor RNA is designated SEQ ID:5658, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5658 is located from position 26917372 to position 26917455 relative to chromosome 7 on the `-` strand.

GAM7553 precursor RNA folds onto itself, forming GAM7553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7553 precursor RNA, designated SEQ ID NO: 5658, and a schematic representation of a predicted secondary folding of GAM7553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7553 folded precursor RNA yielding a GAM7553 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7553 RNA, hereby incorporated herein. Expression of GAM7553 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7553 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7553 target RNA, herein designated GAM TARGET RNA. GAM7553 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7553 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7553 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7553 RNA, herein designated GAM RNA, to target binding sites on GAM7553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7553 target RNA into GAM7553 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7553 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7553 target genes. The mRNA of each one of this plurality of GAM7553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7553 RNA, herein designated GAM RNA, and which when bound by GAM7553 RNA causes inhibition of translation of the GAM7553 target mRNA into a corresponding GAM7553 target protein.

The mechanism of the translational inhibition exerted by GAM7553 RNA, herein designated GAM RNA, on one or more GAM7553 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7553 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7553 RNA, herein designated GAM RNA, of GAM7553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7553 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7553 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7553 RNA correlate with, and may be deduced from, the identity of the GAM7553 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7559 7274 TGTGGCTCTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTCCCTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCACTCTCCC Messenger 7559 (GAM7559) oligonucleotides modulates expression of respective target genes
TATAACTGGC whose function and utility is known in the art.

CTCTCCCTGC GAM7559 is a novel bioinformatically detectable regulatory, non protein coding,
TCAGACCTTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7559 was detected is

CTGGACGAGC described with additional reference to Figs. 9-15.

TGCATGAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGGCAGCTG encoded by the human genome.

CA GAM7559 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7559
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7559
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7559 precursor RNA is designated SEQ ID:7274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7274 is located from position 49747946 to position 49748037 relative to chromosome 12 on the `+` strand.

GAM7559 precursor RNA folds onto itself, forming GAM7559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7559 precursor RNA, designated SEQ ID NO: 7274, and a schematic representation of a predicted secondary folding of GAM7559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7559 folded precursor RNA yielding a GAM7559 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7559 RNA, hereby incorporated herein.

GAM7559 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7559 target RNA, herein designated GAM TARGET RNA. GAM7559 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7559 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7559 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7559 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7559 RNA, herein designated GAM RNA, to target binding sites on GAM7559 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7559 target RNA into GAM7559 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7559 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7559 target genes. The mRNA of each one of this plurality of GAM7559 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7559 RNA, herein designated GAM RNA, and which when bound by GAM7559 RNA causes inhibition of translation of the GAM7559 target mRNA into a corresponding GAM7559 target protein.

The mechanism of the translational inhibition exerted by GAM7559 RNA, herein designated GAM RNA, on one or more GAM7559 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7559 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7559 RNA, herein designated GAM RNA, of GAM7559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7559 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7559 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7559 RNA correlate with, and may be deduced from, the identity of the GAM7559 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7591 7346 TTTGGAGTAA Fig. 8 further provides a conceptual description of another novel bioinformatically
TTCAGTATAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTCGTTTAA Messenger 7591 (GAM7591) oligonucleotides modulates expression of respective target genes
AAGAGATTTT whose function and utility is known in the art.

TATAACTTCA GAM7591 is a novel bioinformatically detectable regulatory, non protein coding,
GA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7591 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM7591 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7591

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7591
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7591 precursor RNA is designated SEQ ID:7346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7346 is located from position 136686979 to position 136687030 relative to chromosome 2 on the `-` strand.

GAM7591 precursor RNA folds onto itself, forming GAM7591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7591 precursor RNA, designated SEQ ID NO: 7346, and a schematic representation of a predicted secondary folding of GAM7591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7591 folded precursor RNA yielding a GAM7591 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7591 RNA, hereby incorporated herein. Expression of GAM7591 RNA

was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7591 target RNA, herein designated GAM TARGET RNA. GAM7591 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7591 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7591 RNA, herein designated GAM RNA, to target binding sites on GAM7591 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7591 target RNA into GAM7591 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7591 target genes. The mRNA of each one of this plurality of GAM7591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7591 RNA, herein designated GAM RNA, and which when bound by GAM7591 RNA causes inhibition of translation of the GAM7591 target mRNA into a corresponding GAM7591 target protein.

The mechanism of the translational inhibition exerted by GAM7591 RNA, herein designated GAM RNA, on one or more GAM7591 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7591 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7591 RNA, herein designated GAM RNA, of GAM7591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7591 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7591 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7591 RNA correlate with, and may be deduced from, the identity of the GAM7591 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGCTTCTGG whose function and utility is known in the art.

TTGTGTAATG GAM7601 is a novel bioinformatically detectable regulatory, non protein coding,

CTGGGGTTTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7601 was detected is

AAGTCACCAT described with additional reference to Figs. 9-15.

TTGTGGGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCATCAATT encoded by the human genome.

AAT GAM7601 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7601

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7601

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7601 precursor RNA is designated SEQ ID:5980, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5980 is located from position 92812990 to position 92813082 relative to chromosome 11 on the `+` strand.

GAM7601 precursor RNA folds onto itself, forming GAM7601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7601 precursor RNA, designated SEQ ID NO: 5980, and a schematic representation of a predicted secondary folding of GAM7601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7601 folded precursor RNA yielding a GAM7601 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7601 RNA, hereby incorporated herein.

GAM7601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7601 target RNA, herein designated GAM TARGET RNA. GAM7601 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7601 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7601 RNA, herein designated GAM RNA, to target binding sites on GAM7601 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7601 target RNA into GAM7601 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7601 target genes. The mRNA of each one of this plurality of GAM7601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7601 RNA, herein designated GAM RNA, and which when bound by GAM7601 RNA causes inhibition of translation of the GAM7601 target mRNA into a corresponding GAM7601 target protein.

The mechanism of the translational inhibition exerted by GAM7601 RNA, herein designated GAM RNA, on one or more GAM7601 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7601 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7601 RNA, herein designated GAM RNA, of GAM7601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7601 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7601 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7601 RNA correlate with, and may be deduced from, the identity of the GAM7601 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7636 6218 CTGCCTATAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATTCATT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGATGGTTT Messenger 7636 (GAM7636) oligonucleotides modulates expression of respective target genes

GTATCTCAAA whose function and utility is known in the art.

GGAGTACAGT GAM7636 is a novel bioinformatically detectable regulatory, non protein coding,

GAACGAAACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7636 was detected is

TGTTTAAAGA described with additional reference to Figs. 9-15.

TACACCGGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAAAAAGAG encoded by the human genome.

AAGAGGCAG GAM7636 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7636

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7636

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7636 precursor RNA is designated SEQ ID:6218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6218 is located from position 88520255 to position 88520353 relative to chromosome 9 on the `+` strand.

GAM7636 precursor RNA folds onto itself, forming GAM7636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7636 precursor RNA, designated SEQ ID NO: 6218, and a schematic representation of a predicted secondary folding of GAM7636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7636 folded precursor RNA yielding a GAM7636 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7636 RNA, hereby incorporated herein.

GAM7636 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7636 target RNA, herein designated GAM TARGET RNA. GAM7636 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7636 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7636 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7636 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7636 RNA, herein designated GAM RNA, to target binding sites on GAM7636 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7636 target RNA into GAM7636 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7636 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7636 target genes. The mRNA of each one of this plurality of GAM7636 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7636 RNA, herein designated GAM RNA, and which when bound by GAM7636 RNA causes inhibition of translation of the GAM7636 target mRNA into a corresponding GAM7636 target protein.

The mechanism of the translational inhibition exerted by GAM7636 RNA, herein designated GAM RNA, on one or more GAM7636 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7636 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7636 RNA, herein designated GAM RNA, of GAM7636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7636 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7636 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7636 RNA correlate with, and may be deduced from, the identity of the GAM7636 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7654 6226 CTGGATTCCC Fig. 8 further provides a conceptual description of another novel bioinformatically
CAAAGCTCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGTTTGGCAC Messenger 7654 (GAM7654) oligonucleotides modulates expression of respective target genes
TGAATCATAT whose function and utility is known in the art.

ACAATCTCGT GAM7654 is a novel bioinformatically detectable regulatory, non protein coding,
AGTTTGGATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7654 was detected is

GCTGTGTGTG described with additional reference to Figs. 9-15.

ACTGCAGACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTAGACAGC encoded by the human genome.

AGGGCCCACA GAM7654 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7654
TCACAG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7654
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7654 precursor RNA is designated SEQ ID:6226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:6226 is located from position 102859212 to position 102859317 relative to chromosome 10 on the `-` strand.

GAM7654 precursor RNA folds onto itself, forming GAM7654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7654 precursor RNA, designated SEQ ID NO: 6226, and a schematic representation of a predicted secondary folding of GAM7654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7654 folded precursor RNA yielding a GAM7654 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7654 RNA, hereby incorporated herein.

GAM7654 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7654 target RNA, herein designated GAM TARGET RNA. GAM7654 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7654 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7654 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7654 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7654 RNA, herein designated GAM RNA, to target binding sites on GAM7654 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7654 target RNA into GAM7654 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7654 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7654 target genes. The mRNA of each one of this

plurality of GAM7654 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7654 RNA, herein designated GAM RNA, and which when bound by GAM7654 RNA causes inhibition of translation of the GAM7654 target mRNA into a corresponding GAM7654 target protein.

The mechanism of the translational inhibition exerted by GAM7654 RNA, herein designated GAM RNA, on one or more GAM7654 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7654 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7654 RNA, herein designated GAM RNA, of GAM7654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7654 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7654 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7654 RNA correlate with, and may be deduced from, the identity of the GAM7654 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7663 6078 CCCCGAGGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGACTGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCAGTCCCC Messenger 7663 (GAM7663) oligonucleotides modulates expression of respective target genes

AGCACCCTTG whose function and utility is known in the art.

TCCAGATGGG GAM7663 is a novel bioinformatically detectable regulatory, non protein coding,

GACCAGGAGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7663 was detected is

TGGGTGAAGA described with additional reference to Figs. 9-15.

TATTTGGGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGAGCTCTG encoded by the human genome.

TGCTGGTTGC GAM7663 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7663

CCCCGAGGGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7663 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7663 precursor RNA is designated SEQ ID:6078, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6078 is located from position 68334837 to position 68334946 relative to chromosome 11 on the `+` strand.

GAM7663 precursor RNA folds onto itself, forming GAM7663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7663 precursor RNA, designated SEQ ID NO: 6078, and a schematic representation of a predicted secondary folding of GAM7663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7663 folded precursor RNA yielding a GAM7663 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7663 RNA, hereby incorporated herein.

GAM7663 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7663 target RNA, herein designated GAM TARGET RNA. GAM7663 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7663 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7663 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7663 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7663 RNA, herein designated GAM RNA, to target binding sites on GAM7663 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7663 target RNA

into GAM7663 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7663 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7663 target genes. The mRNA of each one of this plurality of GAM7663 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7663 RNA, herein designated GAM RNA, and which when bound by GAM7663 RNA causes inhibition of translation of the GAM7663 target mRNA into a corresponding GAM7663 target protein.

The mechanism of the translational inhibition exerted by GAM7663 RNA, herein designated GAM RNA, on one or more GAM7663 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7663 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7663 RNA, herein designated GAM RNA, of GAM7663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7663 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7663 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7663 RNA correlate with, and may be deduced from, the identity of the GAM7663 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7700 5950 ATACTTACTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCATATTATA detected oligonucleotides of the present invention, referred to here as Genomic Address
TAGCTCTAAG Messenger 7700 (GAM7700) oligonucleotides modulates expression of respective target genes

AGTGTAGAGT whose function and utility is known in the art.

TATATGATGT GAM7700 is a novel bioinformatically detectable regulatory, non protein coding,
GCTAGTGAAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7700 was detected is

TGT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7700 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7700 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7700 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7700 precursor RNA is designated SEQ ID:5950, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5950 is located from position 101882286 to position 101882348 relative to chromosome 8 on the `+` strand.

GAM7700 precursor RNA folds onto itself, forming GAM7700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7700 precursor RNA, designated SEQ ID NO: 5950, and a schematic representation of a predicted secondary folding of GAM7700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7700 folded precursor RNA yielding a GAM7700 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7700 RNA, hereby incorporated herein.

GAM7700 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7700 target RNA, herein designated GAM TARGET RNA. GAM7700 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7700 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7700 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7700 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7700 RNA, herein designated GAM RNA, to target binding sites on GAM7700 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7700 target RNA into GAM7700 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7700 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7700 target genes. The mRNA of each one of this plurality of GAM7700 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7700 RNA, herein designated GAM RNA, and which when bound by GAM7700 RNA causes inhibition of translation of the GAM7700 target mRNA into a corresponding GAM7700 target protein.

The mechanism of the translational inhibition exerted by GAM7700 RNA, herein designated GAM RNA, on one or more GAM7700 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7700 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7700 RNA, herein designated GAM RNA, of GAM7700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7700 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7700 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7700 RNA correlate with, and may be deduced from, the identity of the GAM7700 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7707 6191 CTGAAAGTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATCTGCTGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

ACGCCTGGGC Messenger 7707 (GAM7707) oligonucleotides modulates expression of respective target genes

ACATACTGCA whose function and utility is known in the art.

TCATTTACAA GAM7707 is a novel bioinformatically detectable regulatory, non protein coding,

AACTGTAGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7707 was detected is

CACCTGTTGT described with additional reference to Figs. 9-15.

GTGTGCAGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGATTTCTT encoded by the human genome.

ATAGATTTTT GAM7707 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7707

AG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7707

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7707 precursor RNA is designated SEQ ID:6191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6191 is located from position 68168613 to position 68168714 relative to chromosome 9 on the `+` strand.

GAM7707 precursor RNA folds onto itself, forming GAM7707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7707 precursor RNA, designated SEQ ID NO: 6191, and a schematic representation of a predicted secondary folding of GAM7707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7707 folded precursor RNA yielding a GAM7707 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7707 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7707 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7707 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7707 target RNA, herein designated GAM TARGET RNA. GAM7707 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7707 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7707 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7707 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7707 RNA, herein designated GAM RNA, to target binding sites on GAM7707 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7707 target RNA into GAM7707 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7707 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7707 target genes. The mRNA of each one of this plurality of GAM7707 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7707 RNA, herein designated GAM RNA, and which when bound by GAM7707 RNA causes inhibition of translation of the GAM7707 target mRNA into a corresponding GAM7707 target protein.

The mechanism of the translational inhibition exerted by GAM7707 RNA, herein designated GAM RNA, on one or more GAM7707 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7707 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7707 RNA, herein designated GAM RNA, of GAM7707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7707 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7707 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7707 RNA correlate with, and may be deduced from, the identity of the GAM7707 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7729 7226 TGGCCTCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGCTTCCAT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCCCCATCT Messenger 7729 (GAM7729) oligonucleotides modulates expression of respective target genes

GTAAGATAGG whose function and utility is known in the art.

AATAACACAT GAM7729 is a novel bioinformatically detectable regulatory, non protein coding, CTCACAGGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7729 was detected is

CATGGAGAGG described with additional reference to Figs. 9-15.

CTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7729 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7729

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7729

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7729 precursor RNA is designated SEQ ID:7226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7226 is located from position 37886140 to position 37886212 relative to chromosome 22 on the `-` strand.

GAM7729 precursor RNA folds onto itself, forming GAM7729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7729 precursor RNA, designated SEQ ID NO: 7226, and a schematic representation of a predicted secondary folding of GAM7729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7729 folded precursor RNA yielding a GAM7729 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7729 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7729 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7729 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7729 target RNA, herein designated GAM TARGET RNA. GAM7729 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7729 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM7729 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7729 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7729 RNA, herein designated GAM RNA, to target binding sites on GAM7729 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7729 target RNA into GAM7729 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7729 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7729 target genes. The mRNA of each one of this plurality of GAM7729 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7729 RNA, herein designated GAM RNA, and which when bound by GAM7729 RNA causes inhibition of translation of the GAM7729 target mRNA into a corresponding GAM7729 target protein.

The mechanism of the translational inhibition exerted by GAM7729 RNA, herein designated GAM RNA, on one or more GAM7729 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7729 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7729 RNA, herein designated GAM RNA, of GAM7729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7729 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7729 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7729 RNA correlate with, and may be deduced from, the identity of the GAM7729 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7776 6393 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAGG Messenger 7776 (GAM7776) oligonucleotides modulates expression of respective target genes

CGGAGGTTGT whose function and utility is known in the art.

GGTGAGCGAA GAM7776 is a novel bioinformatically detectable regulatory, non protein coding,

GATCGTGCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7776 was detected is

TTGCACTCCA described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGCAAA encoded by the human genome.

ACTCTGTCTC GAM7776 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7776

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7776

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7776 precursor RNA is designated SEQ ID:6393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6393 is located from position 120997504 to position 120997603 relative to chromosome X on the `+` strand.

GAM7776 precursor RNA folds onto itself, forming GAM7776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7776 precursor RNA, designated SEQ ID NO: 6393, and a schematic representation of a predicted secondary folding of GAM7776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7776 folded precursor RNA yielding a GAM7776 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7776 RNA, hereby incorporated herein. Expression of GAM7776 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7776 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM7776 target RNA, herein designated GAM TARGET RNA. GAM7776 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7776 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7776 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7776 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7776 RNA, herein designated GAM RNA, to target binding sites on GAM7776 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7776 target RNA into GAM7776 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7776 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7776 target genes. The mRNA of each one of this plurality of GAM7776 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7776 RNA, herein designated GAM RNA, and which when bound by GAM7776 RNA causes inhibition of translation of the GAM7776 target mRNA into a corresponding GAM7776 target protein.

The mechanism of the translational inhibition exerted by GAM7776 RNA, herein designated GAM RNA, on one or more GAM7776 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7776 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7776 RNA, herein designated GAM RNA, of GAM7776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7776 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM7776 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7776 RNA correlate with, and may be deduced from, the identity of the GAM7776 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7777 5743 AGCAGACTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTGTTGACC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAATTTGTT Messenger 7777 (GAM7777) oligonucleotides modulates expression of respective target genes

AGATTGCTAT whose function and utility is known in the art.

TACAATGCTG GAM7777 is a novel bioinformatically detectable regulatory, non protein coding,

ATTATATTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7777 was detected is

ATAGCAATTA described with additional reference to Figs. 9-15.

CTGACATAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTTATACTTT encoded by the human genome.

GGGCAATGGC GAM7777 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7777

T precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7777

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7777 precursor RNA is designated SEQ ID:5743, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5743 is located from position 96304357 to position 96304457 relative to chromosome 11 on the `-` strand.

GAM7777 precursor RNA folds onto itself, forming GAM7777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7777 precursor RNA, designated SEQ ID NO: 5743, and a schematic representation of a predicted secondary folding of GAM7777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7777 folded precursor RNA yielding a GAM7777 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an

enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7777 RNA, hereby incorporated herein.

GAM7777 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7777 target RNA, herein designated GAM TARGET RNA. GAM7777 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7777 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7777 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7777 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7777 RNA, herein designated GAM RNA, to target binding sites on GAM7777 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7777 target RNA into GAM7777 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7777 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7777 target genes. The mRNA of each one of this plurality of GAM7777 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7777 RNA, herein designated GAM RNA, and which when bound by GAM7777 RNA causes inhibition of translation of the GAM7777 target mRNA into a corresponding GAM7777 target protein.

The mechanism of the translational inhibition exerted by GAM7777 RNA, herein designated GAM RNA, on one or more GAM7777 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7777 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7777 RNA, herein designated GAM RNA, of GAM7777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7777 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7777 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7777 RNA correlate with, and may be deduced from, the identity of the GAM7777 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAGGAAATTT described with additional reference to Figs. 9-15.

AACAGACAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CACAGCCAAA encoded by the human genome.

GAGTGTCATG GAM7784 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7784
TGAATTAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7784

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7784 precursor RNA is designated SEQ ID:6867, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6867 is located from position 107796034 to position 107796141 relative to chromosome 13 on the `+` strand.

GAM7784 precursor RNA folds onto itself, forming GAM7784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7784 precursor RNA, designated SEQ ID NO: 6867, and a schematic representation of a predicted secondary folding of GAM7784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7784 folded precursor RNA yielding a GAM7784 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7784 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7784 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7784 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7784 target RNA, herein designated GAM TARGET RNA. GAM7784 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7784 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7784 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7784 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7784 RNA, herein designated GAM RNA, to target binding sites on GAM7784 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7784 target RNA into GAM7784 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7784 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7784 target genes. The mRNA of each one of this plurality of GAM7784 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7784 RNA, herein designated GAM RNA, and which when bound by GAM7784 RNA causes inhibition of translation of the GAM7784 target mRNA into a corresponding GAM7784 target protein.

The mechanism of the translational inhibition exerted by GAM7784 RNA, herein designated GAM RNA, on one or more GAM7784 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7784 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7784 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7784 RNA, herein designated GAM RNA, of GAM7784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7784 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7784 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7784 RNA correlate with, and may be deduced from, the identity of the GAM7784 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TACCCTGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TCCTGGTTGA Messenger 7837 (GAM7837) oligonucleotides modulates expression of respective target genes
GGGGTGGGGG whose function and utility is known in the art.

AATCAGAAAA GAM7837 is a novel bioinformatically detectable regulatory, non protein coding,
GTAGGTTTAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7837 was detected is

ATTTAACATT described with additional reference to Figs. 9-15.

TTTCTTAACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACATTCACTT encoded by the human genome.

CTTAAAAAGG GAM7837 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7837
AACAAGAAGT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7837
GTAAATAAGT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
ATGTATAGAG to the nucleotide sequence of GAM7837 precursor RNA is designated SEQ ID:7303, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7303 is located from position 29387505 to position 29387634 relative to chromosome 12 on the `+` strand.

GAM7837 precursor RNA folds onto itself, forming GAM7837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7837 precursor RNA, designated SEQ ID NO: 7303, and a schematic representation of a predicted secondary folding of GAM7837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7837 folded precursor RNA yielding a GAM7837 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7837 RNA, hereby incorporated herein.

GAM7837 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7837 target RNA, herein designated GAM TARGET RNA. GAM7837 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7837 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7837 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7837 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7837 RNA, herein designated GAM RNA, to target binding sites on GAM7837 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7837 target RNA into GAM7837 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7837 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7837 target genes. The mRNA of each one of this plurality of GAM7837 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7837 RNA, herein

designated GAM RNA, and which when bound by GAM7837 RNA causes inhibition of translation of the GAM7837 target mRNA into a corresponding GAM7837 target protein.

The mechanism of the translational inhibition exerted by GAM7837 RNA, herein designated GAM RNA, on one or more GAM7837 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7837 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7837 RNA, herein designated GAM RNA, of GAM7837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7837 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7837 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7837 RNA correlate with, and may be deduced from, the identity of the GAM7837 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7845 5732 AGAGGTGTTC Fig. 8 further provides a conceptual description of another novel bioinformatically
CTTAGGCCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCTGCCCT Messenger 7845 (GAM7845) oligonucleotides modulates expression of respective target genes
CCCTGGACTG whose function and utility is known in the art.

CCTGACCTCG GAM7845 is a novel bioinformatically detectable regulatory, non protein coding,
CTCCAAGGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7845 was detected is

CAGGGGAAGG described with additional reference to Figs. 9-15.

TTCTGAGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGTGTGAAA encoded by the human genome.

ATGCTTGGAA GAM7845 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7845
TGTCCCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7845

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7845 precursor RNA is designated SEQ ID:5732, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5732 is located from position 68013714 to position 68013820 relative to chromosome 11 on the `+` strand.

GAM7845 precursor RNA folds onto itself, forming GAM7845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7845 precursor RNA, designated SEQ ID NO: 5732, and a schematic representation of a predicted secondary folding of GAM7845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7845 folded precursor RNA yielding a GAM7845 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7845 RNA, hereby incorporated herein.

GAM7845 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7845 target RNA, herein designated GAM TARGET RNA. GAM7845 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7845 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7845 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7845 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7845 RNA, herein designated GAM RNA, to target binding sites on GAM7845 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7845 target RNA into GAM7845 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7845 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7845 target genes. The mRNA of each one of this plurality of GAM7845 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7845 RNA, herein designated GAM RNA, and which when bound by GAM7845 RNA causes inhibition of translation of the GAM7845 target mRNA into a corresponding GAM7845 target protein.

The mechanism of the translational inhibition exerted by GAM7845 RNA, herein designated GAM RNA, on one or more GAM7845 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7845 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7845 RNA, herein designated GAM RNA, of GAM7845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7845 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7845 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7845 RNA correlate with, and may be deduced from, the identity of the GAM7845 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7854 7232 TGGGATTACA Fig. 8 further provides a conceptual description of another novel bioinformatically

GACATGAGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTGTGCCCA Messenger 7854 (GAM7854) oligonucleotides modulates expression of respective target genes

GCCAGGGCTG whose function and utility is known in the art.

TGTGTTATGT GAM7854 is a novel bioinformatically detectable regulatory, non protein coding,

AGTGACAGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7854 was detected is

CACTGATACA described with additional reference to Figs. 9-15.

GCTCTCTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGACTTAGG encoded by the human genome.

AACCAAGTTT GAM7854 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7854
GACCCCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7854
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7854 precursor RNA is designated SEQ ID:7232, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7232 is located from position 52841049 to position 52841155 relative to chromosome 19 on the `-` strand.

GAM7854 precursor RNA folds onto itself, forming GAM7854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7854 precursor RNA, designated SEQ ID NO: 7232, and a schematic representation of a predicted secondary folding of GAM7854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7854 folded precursor RNA yielding a GAM7854 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7854 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7854 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7854 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7854 target RNA, herein designated GAM TARGET RNA. GAM7854 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7854 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7854 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7854 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7854 RNA, herein designated GAM RNA, to target binding sites on GAM7854 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7854 target RNA into GAM7854 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7854 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7854 target genes. The mRNA of each one of this plurality of GAM7854 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7854 RNA, herein designated GAM RNA, and which when bound by GAM7854 RNA causes inhibition of translation of the GAM7854 target mRNA into a corresponding GAM7854 target protein.

The mechanism of the translational inhibition exerted by GAM7854 RNA, herein designated GAM RNA, on one or more GAM7854 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7854 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7854 RNA, herein designated GAM RNA, of GAM7854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7854 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7854 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7854 RNA correlate with, and may be deduced from, the identity of the GAM7854 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGGTTTCTCA GAM7889 is a novel bioinformatically detectable regulatory, non protein coding,

GACCTCTTAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7889 was detected is

ATTGAGAAGA described with additional reference to Figs. 9-15.

TGTGGCATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGTAAG encoded by the human genome.

GAM7889 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7889 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7889 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7889 precursor RNA is designated SEQ ID:6250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6250 is located from position 50175600 to position 50175686 relative to chromosome 20 on the `-` strand.

GAM7889 precursor RNA folds onto itself, forming GAM7889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7889 precursor RNA, designated SEQ ID NO: 6250, and a schematic representation of a predicted secondary folding of GAM7889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7889 folded precursor RNA yielding a GAM7889 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7889 RNA, hereby incorporated herein.

GAM7889 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7889 target RNA, herein designated GAM TARGET RNA. GAM7889 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7889 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7889 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7889 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7889 RNA, herein designated GAM RNA, to target binding sites on GAM7889 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7889 target RNA into GAM7889 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7889 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7889 target genes. The mRNA of each one of this plurality of GAM7889 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7889 RNA, herein designated GAM RNA, and which when bound by GAM7889 RNA causes inhibition of translation of the GAM7889 target mRNA into a corresponding GAM7889 target protein.

The mechanism of the translational inhibition exerted by GAM7889 RNA, herein designated GAM RNA, on one or more GAM7889 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7889 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7889 RNA, herein designated GAM RNA, of GAM7889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7889 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7889 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7889 RNA correlate with, and may be deduced from, the identity of the GAM7889 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7898 7347 TTTTAGCATG Fig. 8 further provides a conceptual description of another novel bioinformatically
GCTTGTAATA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCAAACAGTT Messenger 7898 (GAM7898) oligonucleotides modulates expression of respective target genes
TGTAATAGCA whose function and utility is known in the art.

ATGACGTGTT GAM7898 is a novel bioinformatically detectable regulatory, non protein coding,
ATTTATTGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7898 was detected is

GCATTGTTTG described with additional reference to Figs. 9-15.

TAATAGCAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATACTGGAA encoded by the human genome.

GAM7898 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7898

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7898

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7898 precursor RNA is designated SEQ ID:7347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7347 is located from position 47657707 to position 47657795 relative to chromosome 11 on the `+` strand.

GAM7898 precursor RNA folds onto itself, forming GAM7898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7898 precursor RNA, designated SEQ ID NO: 7347, and a schematic representation of a predicted secondary folding of GAM7898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7898 folded precursor RNA yielding a GAM7898 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7898 RNA, hereby incorporated herein.

GAM7898 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7898 target RNA, herein designated GAM TARGET RNA. GAM7898 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7898 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7898 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7898 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7898 RNA, herein designated GAM RNA, to target binding sites on GAM7898 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7898 target RNA into GAM7898 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7898 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7898 target genes. The mRNA of each one of this plurality of GAM7898 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7898 RNA, herein designated GAM RNA, and which when bound by GAM7898 RNA causes inhibition of translation of the GAM7898 target mRNA into a corresponding GAM7898 target protein.

The mechanism of the translational inhibition exerted by GAM7898 RNA, herein designated GAM RNA, on one or more GAM7898 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7898 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7898 RNA, herein designated GAM RNA, of GAM7898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM7898 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7898 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7898 RNA correlate with, and may be deduced from, the identity of the GAM7898 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7902 7301 TTCCCTGAGA Fig. 8 further provides a conceptual description of another novel bioinformatically
CTCTTTAACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTTGAAAAA Messenger 7902 (GAM7902) oligonucleotides modulates expression of respective target genes
AGTTGATGCT whose function and utility is known in the art.

GTTTTATTTG GAM7902 is a novel bioinformatically detectable regulatory, non protein coding,
AAAAATCGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM7902 was detected is

AAGACTATTA described with additional reference to Figs. 9-15.

AAAGGCAAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGGGA encoded by the human genome.

GAM7902 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7902

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7902
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7902 precursor RNA is designated SEQ ID:7301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7301 is located from position 29022047 to position 29022132 relative to chromosome 10 on the `+` strand.

GAM7902 precursor RNA folds onto itself, forming GAM7902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7902 precursor RNA, designated SEQ ID NO: 7301, and a schematic representation of a predicted secondary folding of GAM7902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7902 folded precursor RNA yielding a GAM7902 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7902 RNA, hereby incorporated herein.

GAM7902 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7902 target RNA, herein designated GAM TARGET RNA. GAM7902 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7902 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7902 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7902 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7902 RNA, herein designated GAM RNA, to target binding sites on GAM7902 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7902 target RNA into GAM7902 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7902 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7902 target genes. The mRNA of each one of this plurality of GAM7902 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7902 RNA, herein designated GAM RNA, and which when bound by GAM7902 RNA causes inhibition of translation of the GAM7902 target mRNA into a corresponding GAM7902 target protein.

The mechanism of the translational inhibition exerted by GAM7902 RNA, herein designated GAM RNA, on one or more GAM7902 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7902 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7902 RNA, herein designated GAM RNA, of

GAM7902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7902 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7902 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7902 RNA correlate with, and may be deduced from, the identity of the GAM7902 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7911 6296 GAAGCTACCT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTCCTTCAG Messenger 7911 (GAM7911) oligonucleotides modulates expression of respective target genes

CCCTAGCTGC whose function and utility is known in the art.

TTTTATTCTG GAM7911 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTTTATTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7911 was detected is

AAACAAAAAG described with additional reference to Figs. 9-15.

AGGGGGAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTGAAGGAA encoded by the human genome.

ACTAGTTTTC GAM7911 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7911

TGTACAAAGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7911

CTTT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7911 precursor RNA is designated SEQ ID:6296, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6296 is located from position 25092986 to position 25093099 relative to chromosome 8 on the `+` strand.

GAM7911 precursor RNA folds onto itself, forming GAM7911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7911 precursor RNA, designated SEQ ID NO: 6296, and a schematic representation of a predicted secondary folding of GAM7911 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7911 folded precursor RNA yielding a GAM7911 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7911 RNA, hereby incorporated herein.

GAM7911 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7911 target RNA, herein designated GAM TARGET RNA. GAM7911 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7911 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7911 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7911 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7911 RNA, herein designated GAM RNA, to target binding sites on GAM7911 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7911 target RNA into GAM7911 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7911 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7911 target genes. The mRNA of each one of this plurality of GAM7911 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7911 RNA, herein designated GAM RNA, and which when bound by GAM7911 RNA causes inhibition of translation of the GAM7911 target mRNA into a corresponding GAM7911 target protein.

The mechanism of the translational inhibition exerted by GAM7911 RNA, herein designated GAM RNA, on one or more GAM7911 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7911 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM7911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7911 RNA, herein designated GAM RNA, of GAM7911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7911 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7911 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7911 RNA correlate with, and may be deduced from, the identity of the GAM7911 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7915 5822 AGTTCAGACA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCTAGACTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCCGTCAGA Messenger 7915 (GAM7915) oligonucleotides modulates expression of respective target genes

CTCAGTTTCA whose function and utility is known in the art.

AAAGAGAATG GAM7915 is a novel bioinformatically detectable regulatory, non protein coding,

TGTGGGAGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM7915 was detected is

CAGTCTTTGT described with additional reference to Figs. 9-15.

CCGACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7915 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7915

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7915

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7915 precursor RNA is designated SEQ ID:5822, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5822 is located from position 14497507 to position 14497582 relative to chromosome 4 on the `-` strand.

GAM7915 precursor RNA folds onto itself, forming GAM7915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7915 precursor RNA, designated SEQ ID NO: 5822, and a schematic representation of a predicted secondary folding of GAM7915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7915 folded precursor RNA yielding a GAM7915 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM7915 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7915 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM7915 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7915 target RNA, herein designated GAM TARGET RNA. GAM7915 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7915 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7915 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7915 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7915 RNA, herein designated GAM RNA, to target binding sites on GAM7915 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7915 target RNA into GAM7915 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7915 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7915 target genes. The mRNA of each one of this plurality of GAM7915 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7915 RNA, herein designated GAM RNA, and which when bound by GAM7915 RNA causes inhibition of translation of the GAM7915 target mRNA into a corresponding GAM7915 target protein.

The mechanism of the translational inhibition exerted by GAM7915 RNA, herein

designated GAM RNA, on one or more GAM7915 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7915 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7915 RNA, herein designated GAM RNA, of GAM7915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7915 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7915 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7915 RNA correlate with, and may be deduced from, the identity of the GAM7915 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7933 6769 GGCTTCCTCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCACCTTGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

CACTGCTGCT Messenger 7933 (GAM7933) oligonucleotides modulates expression of respective target genes

CCCACACCAC whose function and utility is known in the art.

AGTGACTAGC GAM7933 is a novel bioinformatically detectable regulatory, non protein coding,

AGCACATAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7933 was detected is

GGTTTGAATT described with additional reference to Figs. 9-15.

AAAGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM7933 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7933

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7933

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7933 precursor RNA is designated SEQ ID:6769, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6769 is located from position 3260143 to position 3260218 relative to chromosome 7 on

the `-` strand.

GAM7933 precursor RNA folds onto itself, forming GAM7933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7933 precursor RNA, designated SEQ ID NO: 6769, and a schematic representation of a predicted secondary folding of GAM7933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7933 folded precursor RNA yielding a GAM7933 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7933 RNA, hereby incorporated herein. Expression of GAM7933 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM7933 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7933 target RNA, herein designated GAM TARGET RNA. GAM7933 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7933 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7933 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7933 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7933 RNA, herein designated GAM RNA, to target binding sites on GAM7933 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7933 target RNA into GAM7933 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7933 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM7933 target genes. The mRNA of each one of this plurality of GAM7933 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7933 RNA, herein designated GAM RNA, and which when bound by GAM7933 RNA causes inhibition of translation of the GAM7933 target mRNA into a corresponding GAM7933 target protein.

The mechanism of the translational inhibition exerted by GAM7933 RNA, herein designated GAM RNA, on one or more GAM7933 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7933 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7933 RNA, herein designated GAM RNA, of GAM7933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7933 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7933 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7933 RNA correlate with, and may be deduced from, the identity of the GAM7933 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7954 6709 GGAGGACCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCCAAAGTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGGTGCAGG Messenger 7954 (GAM7954) oligonucleotides modulates expression of respective target genes

GGTGGTCTTA whose function and utility is known in the art.

GGAGGGCTTT GAM7954 is a novel bioinformatically detectable regulatory, non protein coding,

CCTGAAGGAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7954 was detected is

TGGCCAGGGT described with additional reference to Figs. 9-15.

TCACCCATCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTCCACCCAC encoded by the human genome.

GGACCCATCC GAM7954 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7954

TCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7954 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7954 precursor RNA is designated SEQ ID:6709, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6709 is located from position 43546115 to position 43546217 relative to chromosome 19 on the `+` strand.

GAM7954 precursor RNA folds onto itself, forming GAM7954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7954 precursor RNA, designated SEQ ID NO: 6709, and a schematic representation of a predicted secondary folding of GAM7954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7954 folded precursor RNA yielding a GAM7954 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7954 RNA, hereby incorporated herein.

GAM7954 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7954 target RNA, herein designated GAM TARGET RNA. GAM7954 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7954 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7954 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7954 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7954 RNA, herein designated GAM RNA, to target binding sites on GAM7954 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7954 target RNA

into GAM7954 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7954 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7954 target genes. The mRNA of each one of this plurality of GAM7954 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7954 RNA, herein designated GAM RNA, and which when bound by GAM7954 RNA causes inhibition of translation of the GAM7954 target mRNA into a corresponding GAM7954 target protein.

The mechanism of the translational inhibition exerted by GAM7954 RNA, herein designated GAM RNA, on one or more GAM7954 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7954 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7954 RNA, herein designated GAM RNA, of GAM7954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7954 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7954 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7954 RNA correlate with, and may be deduced from, the identity of the GAM7954 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7966 6070 CCCAGAACAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGACCTCTAG detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAACATGTA Messenger 7966 (GAM7966) oligonucleotides modulates expression of respective target genes

AGCACCTAGA whose function and utility is known in the art.

CCATGGTTTC GAM7966 is a novel bioinformatically detectable regulatory, non protein coding,

CCATCCTTAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM7966 was detected is

CATTGTTAAC described with additional reference to Figs. 9-15.

ATTTTGGCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATAGTTCTT encoded by the human genome.

TGTTGTGTGG GAM7966 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7966 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7966 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7966 precursor RNA is designated SEQ ID:6070, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6070 is located from position 67546633 to position 67546732 relative to chromosome 14 on the `-` strand.

GAM7966 precursor RNA folds onto itself, forming GAM7966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7966 precursor RNA, designated SEQ ID NO: 6070, and a schematic representation of a predicted secondary folding of GAM7966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7966 folded precursor RNA yielding a GAM7966 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7966 RNA, hereby incorporated herein.

GAM7966 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7966 target RNA, herein designated GAM TARGET RNA. GAM7966 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7966 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7966 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7966 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7966 RNA, herein designated GAM RNA, to target binding sites on GAM7966 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7966 target RNA into GAM7966 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7966 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7966 target genes. The mRNA of each one of this plurality of GAM7966 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7966 RNA, herein designated GAM RNA, and which when bound by GAM7966 RNA causes inhibition of translation of the GAM7966 target mRNA into a corresponding GAM7966 target protein.

The mechanism of the translational inhibition exerted by GAM7966 RNA, herein designated GAM RNA, on one or more GAM7966 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7966 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7966 RNA, herein designated GAM RNA, of GAM7966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7966 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7966 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7966 RNA correlate with, and may be deduced from, the identity of the GAM7966 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM7980 5999 CACGCGTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTGGTCACC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGCTTAGGA Messenger 7980 (GAM7980) oligonucleotides modulates expression of respective target genes
AGCTCACAAG whose function and utility is known in the art.

GTCCTCATCA GAM7980 is a novel bioinformatically detectable regulatory, non protein coding,
TTTGGAGGTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM7980 was detected is

TTTCCCTGTG described with additional reference to Figs. 9-15.

AGTGCCCTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCCTAGGCT encoded by the human genome.

TTCTTACGTG GAM7980 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM7980

TG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM7980

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM7980 precursor RNA is designated SEQ ID:5999, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5999 is located from position 55163316 to position 55163417 relative to chromosome 15 on the `+` strand.

GAM7980 precursor RNA folds onto itself, forming GAM7980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM7980 precursor RNA, designated SEQ ID NO: 5999, and a schematic representation of a predicted secondary folding of GAM7980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM7980 folded precursor RNA yielding a GAM7980 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM7980 RNA, hereby incorporated herein.

GAM7980 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM7980 target RNA, herein designated GAM TARGET RNA. GAM7980 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM7980 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM7980 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM7980 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM7980 RNA, herein designated GAM RNA, to target binding sites on GAM7980 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM7980 target RNA into GAM7980 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM7980 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM7980 target genes. The mRNA of each one of this plurality of GAM7980 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM7980 RNA, herein designated GAM RNA, and which when bound by GAM7980 RNA causes inhibition of translation of the GAM7980 target mRNA into a corresponding GAM7980 target protein.

The mechanism of the translational inhibition exerted by GAM7980 RNA, herein designated GAM RNA, on one or more GAM7980 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM7980 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM7980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM7980 RNA, herein designated GAM RNA, of GAM7980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM7980 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM7980 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM7980 RNA correlate with, and may be deduced from, the identity of the GAM7980 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8013 6539 GCTCTTGTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCCAGGCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGTGCAGTGG Messenger 8013 (GAM8013) oligonucleotides modulates expression of respective target genes

CATGATCTCA whose function and utility is known in the art.

GCTCACTGCA GAM8013 is a novel bioinformatically detectable regulatory, non protein coding, ACCTCTGCCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8013 was detected is

CCTGGGTTCA described with additional reference to Figs. 9-15.

AGCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8013 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8013

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8013

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8013 precursor RNA is designated SEQ ID:6539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6539 is located from position 36439313 to position 36439388 relative to chromosome 21 on the `+` strand.

GAM8013 precursor RNA folds onto itself, forming GAM8013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8013 precursor RNA, designated SEQ ID NO: 6539, and a schematic representation of a predicted secondary folding of GAM8013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8013 folded precursor RNA yielding a GAM8013 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM8013 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8013 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM8013 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8013 target RNA, herein designated GAM TARGET RNA. GAM8013 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8013 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM8013 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8013 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8013 RNA, herein designated GAM RNA, to target binding sites on GAM8013 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8013 target RNA into GAM8013 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8013 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8013 target genes. The mRNA of each one of this plurality of GAM8013 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8013 RNA, herein designated GAM RNA, and which when bound by GAM8013 RNA causes inhibition of translation of the GAM8013 target mRNA into a corresponding GAM8013 target protein.

The mechanism of the translational inhibition exerted by GAM8013 RNA, herein designated GAM RNA, on one or more GAM8013 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8013 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

TCAGAGCACT Messenger 8031 (GAM8031) oligonucleotides modulates expression of respective target genes

CTATCATGTT whose function and utility is known in the art.

TTTAGGTGTA GAM8031 is a novel bioinformatically detectable regulatory, non protein coding,

TATTGTGTAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8031 was detected is

TCAGGATAGC described with additional reference to Figs. 9-15.

ATTAAAAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACTGATGGC encoded by the human genome.

GAM8031 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8031

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8031

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8031 precursor RNA is designated SEQ ID:6529, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6529 is located from position 26287592 to position 26287680 relative to chromosome 12 on the `+` strand.

GAM8031 precursor RNA folds onto itself, forming GAM8031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8031 precursor RNA, designated SEQ ID NO: 6529, and a schematic representation of a predicted secondary folding of GAM8031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8031 folded precursor RNA yielding a GAM8031 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM8031 RNA, hereby incorporated herein.

GAM8031 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8031 target RNA, herein designated GAM TARGET RNA. GAM8031 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8031 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8031 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8031 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8031 RNA, herein designated GAM RNA, to target binding sites on GAM8031 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8031 target RNA into GAM8031 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8031 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8031 target genes. The mRNA of each one of this plurality of GAM8031 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8031 RNA, herein designated GAM RNA, and which when bound by GAM8031 RNA causes inhibition of translation of the GAM8031 target mRNA into a corresponding GAM8031 target protein.

The mechanism of the translational inhibition exerted by GAM8031 RNA, herein designated GAM RNA, on one or more GAM8031 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8031 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8031 RNA, herein designated GAM RNA, of GAM8031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8031 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8031 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8031 RNA correlate with, and may be deduced from, the identity of the GAM8031 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8047 5705 ACTCTTAAAC Fig. 8 further provides a conceptual description of another novel bioinformatically
CTTTAGAAAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GCTACAGCAT Messenger 8047 (GAM8047) oligonucleotides modulates expression of respective target genes
CTAGCTTCTC whose function and utility is known in the art.

TAGATCAATA GAM8047 is a novel bioinformatically detectable regulatory, non protein coding,
ATCACAGAGG micro RNA (miRNA)-like oligonucleotide. The method by which GAM8047 was detected is

CTTAAGTGCT described with additional reference to Figs. 9-15.

GACCTCATAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGATAAAGAG encoded by the human genome.

T GAM8047 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8047
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8047
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8047 precursor RNA is designated SEQ ID:5705, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5705 is located from position 136594089 to position 136594179 relative to chromosome X on the `+` strand.

GAM8047 precursor RNA folds onto itself, forming GAM8047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8047 precursor RNA, designated SEQ ID NO: 5705, and a schematic representation of a predicted secondary folding of GAM8047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8047 folded precursor RNA

yielding a GAM8047 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8047 RNA, hereby incorporated herein. Expression of GAM8047 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM8047 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8047 target RNA, herein designated GAM TARGET RNA. GAM8047 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8047 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8047 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8047 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8047 RNA, herein designated GAM RNA, to target binding sites on GAM8047 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8047 target RNA into GAM8047 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8047 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8047 target genes. The mRNA of each one of this plurality of GAM8047 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8047 RNA, herein designated GAM RNA, and which when bound by GAM8047 RNA causes inhibition of translation of the GAM8047 target mRNA into a corresponding GAM8047 target protein.

The mechanism of the translational inhibition exerted by GAM8047 RNA, herein designated GAM RNA, on one or more GAM8047 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8047 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8047 RNA, herein designated GAM RNA, of GAM8047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8047 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8047 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8047 RNA correlate with, and may be deduced from, the identity of the GAM8047 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8100 6982 TATGAGGGAC ATGAACACCT GCAGATTTTG GGGTCCACAG GGGTCCTGGA ATTAATTCCC TGTGGATACT GAGAGATGAC TGGACATCCA TTCTCCATG

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 8100 (GAM8100) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM8100 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM8100 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM8100 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8100 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8100 precursor RNA is designated SEQ ID:6982, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6982 is located from position 10904327 to position 10904425 relative to chromosome 18 on the `-` strand.

GAM8100 precursor RNA folds onto itself, forming GAM8100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8100 precursor RNA, designated SEQ ID NO: 6982, and a schematic representation of a predicted secondary folding of GAM8100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8100 folded precursor RNA yielding a GAM8100 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8100 RNA, hereby incorporated herein.

GAM8100 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8100 target RNA, herein designated GAM TARGET RNA. GAM8100 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8100 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8100 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8100 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8100 RNA, herein designated GAM RNA, to target binding sites on GAM8100 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8100 target RNA into GAM8100 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8100 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8100 target genes. The mRNA of each one of this plurality of GAM8100 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8100 RNA, herein designated GAM RNA, and which when bound by GAM8100 RNA causes inhibition of translation of the GAM8100 target mRNA into a corresponding GAM8100 target protein.

The mechanism of the translational inhibition exerted by GAM8100 RNA, herein designated GAM RNA, on one or more GAM8100 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8100 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8100 RNA, herein designated GAM RNA, of GAM8100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8100 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8100 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8100 RNA correlate with, and may be deduced from, the identity of the GAM8100 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8109 6310 GACAGGATTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTACAGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCTCATTTC Messenger 8109 (GAM8109) oligonucleotides modulates expression of respective target genes

CTTCATGATT whose function and utility is known in the art.

AGGAATACTA GAM8109 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTGAAATG micro RNA (miRNA)-like oligonucleotide. The method by which GAM8109 was detected is

AGAGACCTGT described with additional reference to Figs. 9-15.

ACTGTATCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TT encoded by the human genome.

GAM8109 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8109

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8109

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8109 precursor RNA is designated SEQ ID:6310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6310 is located from position 48231664 to position 48231745 relative to chromosome 15 on the `+` strand.

GAM8109 precursor RNA folds onto itself, forming GAM8109 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8109 precursor RNA, designated SEQ ID NO: 6310, and a schematic representation of a predicted secondary folding of GAM8109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8109 folded precursor RNA yielding a GAM8109 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8109 RNA, hereby incorporated herein.

GAM8109 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8109 target RNA, herein designated GAM TARGET RNA. GAM8109 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8109 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8109 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8109 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8109 RNA, herein designated GAM RNA, to target binding sites on GAM8109 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8109 target RNA into GAM8109 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8109 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8109 target genes. The mRNA of each one of this plurality of GAM8109 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8109 RNA, herein designated GAM RNA, and which when bound by GAM8109 RNA causes inhibition of translation of the GAM8109 target mRNA into a corresponding GAM8109 target protein.

The mechanism of the translational inhibition exerted by GAM8109 RNA, herein designated GAM RNA, on one or more GAM8109 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8109 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8109 RNA, herein designated GAM RNA, of GAM8109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8109 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8109 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8109 RNA correlate with, and may be deduced from, the identity of the GAM8109 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8145 6589 GGACCAGACT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGTGACAT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGAATGTA Messenger 8145 (GAM8145) oligonucleotides modulates expression of respective target genes

GAGGAATTAT whose function and utility is known in the art.

TCAATGTTCA GAM8145 is a novel bioinformatically detectable regulatory, non protein coding,

GGATCAACAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8145 was detected is

GATCTCCTCA described with additional reference to Figs. 9-15.

CTCTAGGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATCC encoded by the human genome.

GAM8145 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8145

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8145

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8145 precursor RNA is designated SEQ ID:6589, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6589 is located from position 90807704 to position 90807788 relative to chromosome 10 on the `+` strand.

GAM8145 precursor RNA folds onto itself, forming GAM8145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8145 precursor RNA, designated SEQ ID NO: 6589, and a schematic representation of a predicted secondary folding of GAM8145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8145 folded precursor RNA yielding a GAM8145 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8145 RNA, hereby incorporated herein. Expression of GAM8145 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM8145 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8145 target RNA, herein designated GAM TARGET RNA. GAM8145 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8145 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8145 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8145 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8145 RNA, herein designated GAM RNA, to target binding sites on GAM8145 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8145 target RNA into GAM8145 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8145 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8145 target genes. The mRNA of each one of this plurality of GAM8145 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8145 RNA, herein designated GAM RNA, and which when bound by GAM8145 RNA causes inhibition of translation of the GAM8145 target mRNA into a corresponding GAM8145 target protein.

The mechanism of the translational inhibition exerted by GAM8145 RNA, herein designated GAM RNA, on one or more GAM8145 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8145 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8145 RNA, herein designated GAM RNA, of GAM8145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8145 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8145 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8145 RNA correlate with, and may be deduced from, the identity of the GAM8145 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8164 6811 GGGGCAGAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

GGATGGAAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CGGAGATCCC Messenger 8164 (GAM8164) oligonucleotides modulates expression of respective target genes

AGGTTCCCGG whose function and utility is known in the art.

AATACTCCGG GAM8164 is a novel bioinformatically detectable regulatory, non protein coding,

CTGGGGCCTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8164 was detected is

CGGGCTTCTC described with additional reference to Figs. 9-15.

CTGTCCCCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTACCCC encoded by the human genome.

GAM8164 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8164 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8164 precursor RNA is designated SEQ ID:6811, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6811 is located from position 76816710 to position 76816797 relative to chromosome 17 on the `-` strand.

GAM8164 precursor RNA folds onto itself, forming GAM8164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8164 precursor RNA, designated SEQ ID NO: 6811, and a schematic representation of a predicted secondary folding of GAM8164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8164 folded precursor RNA yielding a GAM8164 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8164 RNA, hereby incorporated herein.

GAM8164 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8164 target RNA, herein designated GAM TARGET RNA. GAM8164 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8164 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8164 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8164 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8164 RNA, herein designated GAM RNA, to target binding sites on GAM8164 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8164 target RNA into GAM8164 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8164 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8164 target genes. The mRNA of each one of this plurality of GAM8164 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8164 RNA, herein designated GAM RNA, and which when bound by GAM8164 RNA causes inhibition of translation of the GAM8164 target mRNA into a corresponding GAM8164 target protein.

The mechanism of the translational inhibition exerted by GAM8164 RNA, herein designated GAM RNA, on one or more GAM8164 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8164 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8164 RNA, herein designated GAM RNA, of GAM8164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8164 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8164 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8164 RNA correlate with, and may be deduced from, the identity of the GAM8164 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8206 6320 GAGAATCACT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTGGAGGT Messenger 8206 (GAM8206) oligonucleotides modulates expression of respective target genes

TGCAGTGAGC whose function and utility is known in the art.

CAAGATCGTG GAM8206 is a novel bioinformatically detectable regulatory, non protein coding,

CCATTGCACT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8206 was detected is

CCAGCCTGGG described with additional reference to Figs. 9-15.

TAACAGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGACTC encoded by the human genome.

GAM8206 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8206 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8206 precursor RNA is designated SEQ ID:6320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6320 is located from position 107994686 to position 107994771 relative to chromosome 11 on the `+` strand.

GAM8206 precursor RNA folds onto itself, forming GAM8206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8206 precursor RNA, designated SEQ ID NO: 6320, and a schematic representation of a predicted secondary folding of GAM8206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8206 folded precursor RNA yielding a GAM8206 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8206 RNA, hereby incorporated herein.

GAM8206 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8206 target RNA, herein designated GAM TARGET RNA. GAM8206 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8206 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8206 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8206 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8206 RNA, herein designated GAM RNA, to target binding sites on GAM8206 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8206 target RNA into GAM8206 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8206 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8206 target genes. The mRNA of each one of this plurality of GAM8206 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8206 RNA, herein designated GAM RNA, and which when bound by GAM8206 RNA causes inhibition of translation of the GAM8206 target mRNA into a corresponding GAM8206 target protein.

The mechanism of the translational inhibition exerted by GAM8206 RNA, herein designated GAM RNA, on one or more GAM8206 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8206 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8206 RNA, herein designated GAM RNA, of GAM8206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8206 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8206 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8206 RNA correlate with, and may be deduced from, the identity of the GAM8206 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8276 5717 AGAATCGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACCCAGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCGGAGGTT Messenger 8276 (GAM8276) oligonucleotides modulates expression of respective target genes

GCAGTGAGCC whose function and utility is known in the art.

AGGATCACGC GAM8276 is a novel bioinformatically detectable regulatory, non protein coding, CACTGTACTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8276 was detected is

CACCCTGGGC described with additional reference to Figs. 9-15.

GACAGAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACT encoded by the human genome.

GAM8276 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8276 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8276 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8276 precursor RNA is designated SEQ ID:5717, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5717 is located from position 61627070 to position 61627153 relative to chromosome 19 on the `-` strand.

GAM8276 precursor RNA folds onto itself, forming GAM8276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8276 precursor RNA, designated SEQ ID NO: 5717, and a schematic representation of a predicted secondary folding of GAM8276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8276 folded precursor RNA yielding a GAM8276 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8276 RNA, hereby incorporated herein.

GAM8276 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8276 target RNA, herein designated GAM TARGET RNA. GAM8276 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8276 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8276 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8276 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8276 RNA, herein designated GAM RNA, to target binding sites on GAM8276 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8276 target RNA into GAM8276 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8276 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8276 target genes. The mRNA of each one of this plurality of GAM8276 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8276 RNA, herein designated GAM RNA, and which when bound by GAM8276 RNA causes inhibition of translation of the GAM8276 target mRNA into a corresponding GAM8276 target protein.

The mechanism of the translational inhibition exerted by GAM8276 RNA, herein designated GAM RNA, on one or more GAM8276 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8276 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8276 RNA, herein designated GAM RNA, of GAM8276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8276 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8276 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8276 RNA correlate with, and may be deduced from, the identity of the GAM8276 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8285 6051 CCAGAGGCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGACCATGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TAGTAGACAG Messenger 8285 (GAM8285) oligonucleotides modulates expression of respective target genes

TGGCAACATA whose function and utility is known in the art.

GTCATCCCCA GAM8285 is a novel bioinformatically detectable regulatory, non protein coding,

AGATGCTAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8285 was detected is

CTTCTGCTGG described with additional reference to Figs. 9-15.

AACTGTCATA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGTTATCATG encoded by the human genome.

GTCAATGTAA GAM8285 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8285

ACCTGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8285

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8285 precursor RNA is designated SEQ ID:6051, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6051 is located from position 158626692 to position 158626797 relative to chromosome 1 on the `+` strand.

GAM8285 precursor RNA folds onto itself, forming GAM8285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8285 precursor RNA, designated SEQ ID NO: 6051, and a schematic representation of a predicted secondary folding of GAM8285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8285 folded precursor RNA yielding a GAM8285 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8285 RNA, hereby incorporated herein. Expression of GAM8285 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM8285 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8285 target RNA, herein designated GAM TARGET RNA. GAM8285 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8285 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8285 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8285 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8285 RNA, herein designated GAM RNA, to target binding sites on GAM8285 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8285 target RNA into GAM8285 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8285 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8285 target genes. The mRNA of each one of this plurality of GAM8285 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8285 RNA, herein designated GAM RNA, and which when bound by GAM8285 RNA causes inhibition of translation of the GAM8285 target mRNA into a corresponding GAM8285 target protein.

The mechanism of the translational inhibition exerted by GAM8285 RNA, herein designated GAM RNA, on one or more GAM8285 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8285 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8285 RNA, herein designated GAM RNA, of GAM8285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8285 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8285 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8285 RNA correlate with, and may be deduced from, the identity of the GAM8285 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8288 7243 TGGGGTGCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATCTTCTGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTGTTGGGA Messenger 8288 (GAM8288) oligonucleotides modulates expression of respective target genes

AGGCTCGGTG whose function and utility is known in the art.

GTCCATTTTC GAM8288 is a novel bioinformatically detectable regulatory, non protein coding,

ACCAGTTAAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8288 was detected is

GAATATGAGG described with additional reference to Figs. 9-15.

CCAGCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8288 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8288

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8288

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8288 precursor RNA is designated SEQ ID:7243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7243 is located from position 54931946 to position 54932023 relative to chromosome 18 on the `+` strand.

GAM8288 precursor RNA folds onto itself, forming GAM8288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8288 precursor RNA, designated SEQ ID NO: 7243, and a schematic representation of a predicted secondary folding of GAM8288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8288 folded precursor RNA yielding a GAM8288 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the

nucleotide sequence of GAM8288 RNA, hereby incorporated herein.

GAM8288 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8288 target RNA, herein designated GAM TARGET RNA. GAM8288 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8288 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8288 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8288 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8288 RNA, herein designated GAM RNA, to target binding sites on GAM8288 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8288 target RNA into GAM8288 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8288 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8288 target genes. The mRNA of each one of this plurality of GAM8288 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8288 RNA, herein designated GAM RNA, and which when bound by GAM8288 RNA causes inhibition of translation of the GAM8288 target mRNA into a corresponding GAM8288 target protein.

The mechanism of the translational inhibition exerted by GAM8288 RNA, herein designated GAM RNA, on one or more GAM8288 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8288 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8288 RNA, herein designated GAM RNA, of GAM8288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8288 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8288 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8288 RNA correlate with, and may be deduced from, the identity of the GAM8288 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTAACCAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGTTGGAGG Messenger 8311 (GAM8311) oligonucleotides modulates expression of respective target genes

TTGCAGGGAG whose function and utility is known in the art.

CCGAGATCGC GAM8311 is a novel bioinformatically detectable regulatory, non protein coding,

ACCACTGCAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8311 was detected is

TCCAGCCTGG described with additional reference to Figs. 9-15.

GTGACAAAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM8311 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8311

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8311

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8311 precursor RNA is designated SEQ ID:6622, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6622 is located from position 96904480 to position 96904567 relative to chromosome 15 on the `+` strand.

GAM8311 precursor RNA folds onto itself, forming GAM8311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8311 precursor RNA, designated SEQ ID NO: 6622, and a schematic representation of a predicted secondary folding of GAM8311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8311 folded precursor RNA

yielding a GAM8311 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8311 RNA, hereby incorporated herein.

GAM8311 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8311 target RNA, herein designated GAM TARGET RNA. GAM8311 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8311 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8311 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8311 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8311 RNA, herein designated GAM RNA, to target binding sites on GAM8311 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8311 target RNA into GAM8311 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8311 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8311 target genes. The mRNA of each one of this plurality of GAM8311 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8311 RNA, herein designated GAM RNA, and which when bound by GAM8311 RNA causes inhibition of translation of the GAM8311 target mRNA into a corresponding GAM8311 target protein.

The mechanism of the translational inhibition exerted by GAM8311 RNA, herein designated GAM RNA, on one or more GAM8311 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8311 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8311 RNA, herein designated GAM RNA, of GAM8311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8311 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8311 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8311 RNA correlate with, and may be deduced from, the identity of the GAM8311 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8339 6102 CCTAAAACAT Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGTGAAGAT detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGGCTACAG Messenger 8339 (GAM8339) oligonucleotides modulates expression of respective target genes

TGCTTTTCTC whose function and utility is known in the art.

ATGACATGGA GAM8339 is a novel bioinformatically detectable regulatory, non protein coding,

GCCTTGTTGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8339 was detected is

TTGTTCACTC described with additional reference to Figs. 9-15.

ATTCTAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8339 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8339

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8339

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8339 precursor RNA is designated SEQ ID:6102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6102 is located from position 107487845 to position 107487922 relative to chromosome X on the `+` strand.

GAM8339 precursor RNA folds onto itself, forming GAM8339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8339 precursor RNA, designated SEQ ID NO: 6102, and a

schematic representation of a predicted secondary folding of GAM8339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8339 folded precursor RNA yielding a GAM8339 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8339 RNA, hereby incorporated herein.

GAM8339 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8339 target RNA, herein designated GAM TARGET RNA. GAM8339 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8339 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8339 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8339 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8339 RNA, herein designated GAM RNA, to target binding sites on GAM8339 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8339 target RNA into GAM8339 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8339 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8339 target genes. The mRNA of each one of this plurality of GAM8339 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8339 RNA, herein designated GAM RNA, and which when bound by GAM8339 RNA causes inhibition of translation of the GAM8339 target mRNA into a corresponding GAM8339 target protein.

The mechanism of the translational inhibition exerted by GAM8339 RNA, herein designated GAM RNA, on one or more GAM8339 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8339 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8339 RNA, herein designated GAM RNA, of GAM8339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8339 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8339 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8339 RNA correlate with, and may be deduced from, the identity of the GAM8339 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8349 6859 GTAAATCTCC Fig. 8 further provides a conceptual description of another novel bioinformatically
CTGATACCAT detected oligonucleotides of the present invention, referred to here as Genomic Address
CACTCTTAAA Messenger 8349 (GAM8349) oligonucleotides modulates expression of respective target genes
CCTTTAGAAA whose function and utility is known in the art.

TGCTACAGCA GAM8349 is a novel bioinformatically detectable regulatory, non protein coding,
TCTAGCTTCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8349 was detected is

CTAGATCAAT described with additional reference to Figs. 9-15.

AATCACAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTTAAGTGC encoded by the human genome.

TGACCTCATA GAM8349 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8349
AAGATAAAGA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8349
GTTCCCATGA precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
TTTAC to the nucleotide sequence of GAM8349 precursor RNA is designated SEQ ID:6859, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6859 is located from position 136594068 to position 136594192 relative to chromosome X on the `+` strand.

GAM8349 precursor RNA folds onto itself, forming GAM8349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8349 precursor RNA, designated SEQ ID NO: 6859, and a schematic representation of a predicted secondary folding of GAM8349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8349 folded precursor RNA yielding a GAM8349 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8349 RNA, hereby incorporated herein. Expression of GAM8349 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM8349 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8349 target RNA, herein designated GAM TARGET RNA. GAM8349 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8349 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8349 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8349 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8349 RNA, herein designated GAM RNA, to target binding sites on GAM8349 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8349 target RNA into GAM8349 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8349 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8349 target genes. The mRNA of each one of this plurality of GAM8349 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8349 RNA, herein designated GAM RNA, and which when bound by GAM8349 RNA causes inhibition of translation of the GAM8349 target mRNA into a corresponding GAM8349 target protein.

The mechanism of the translational inhibition exerted by GAM8349 RNA, herein designated GAM RNA, on one or more GAM8349 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8349 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8349 RNA, herein designated GAM RNA, of GAM8349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8349 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8349 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8349 RNA correlate with, and may be deduced from, the identity of the GAM8349 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8362 6532 GCTCACACAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAAGTCTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAAAGCTTA Messenger 8362 (GAM8362) oligonucleotides modulates expression of respective target genes

GGAATGGAAG whose function and utility is known in the art.

TAGGTTGTCC GAM8362 is a novel bioinformatically detectable regulatory, non protein coding,

CCTCCTAGTC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8362 was detected is

ATGGGATCTC described with additional reference to Figs. 9-15.

TCCAACTCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAGACAATCT encoded by the human genome.

TGCTTTACGT GAM8362 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8362

GCTGATGAAC precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8362

ATGCTCTGTG precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar

AGC to the nucleotide sequence of GAM8362 precursor RNA is designated SEQ ID:6532, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6532 is located from position 43562099 to position 43562221 relative to chromosome 15 on the `+` strand.

GAM8362 precursor RNA folds onto itself, forming GAM8362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8362 precursor RNA, designated SEQ ID NO: 6532, and a schematic representation of a predicted secondary folding of GAM8362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8362 folded precursor RNA yielding a GAM8362 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8362 RNA, hereby incorporated herein.

GAM8362 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8362 target RNA, herein designated GAM TARGET RNA. GAM8362 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8362 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8362 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8362 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8362 RNA, herein designated GAM RNA, to target binding sites on GAM8362 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8362 target RNA into GAM8362 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8362 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM8362 target genes. The mRNA of each one of this plurality of GAM8362 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8362 RNA, herein designated GAM RNA, and which when bound by GAM8362 RNA causes inhibition of translation of the GAM8362 target mRNA into a corresponding GAM8362 target protein.

The mechanism of the translational inhibition exerted by GAM8362 RNA, herein designated GAM RNA, on one or more GAM8362 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8362 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8362 RNA, herein designated GAM RNA, of GAM8362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8362 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8362 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8362 RNA correlate with, and may be deduced from, the identity of the GAM8362 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8380 7233 TGGGCAAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGAGAAAGT detected oligonucleotides of the present invention, referred to here as Genomic Address
AAGACTGTGG Messenger 8380 (GAM8380) oligonucleotides modulates expression of respective target genes
GAGGTGACTG whose function and utility is known in the art.

TTACAGATCG GAM8380 is a novel bioinformatically detectable regulatory, non protein coding,
GAAAACTCTG micro RNA (miRNA)-like oligonucleotide. The method by which GAM8380 was detected is

ATTGAACCAT described with additional reference to Figs. 9-15.

TCACTTTATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCCAGTAAA encoded by the human genome.

CTTTCTCAAC GAM8380 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8380

CCCA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8380 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8380 precursor RNA is designated SEQ ID:7233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7233 is located from position 23784450 to position 23784553 relative to chromosome 3 on the `-` strand.

GAM8380 precursor RNA folds onto itself, forming GAM8380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8380 precursor RNA, designated SEQ ID NO: 7233, and a schematic representation of a predicted secondary folding of GAM8380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8380 folded precursor RNA yielding a GAM8380 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM8380 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8380 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM8380 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8380 target RNA, herein designated GAM TARGET RNA. GAM8380 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8380 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8380 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8380 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8380 RNA, herein designated GAM RNA, to target binding sites on GAM8380 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8380 target RNA into GAM8380 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8380 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8380 target genes. The mRNA of each one of this plurality of GAM8380 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8380 RNA, herein designated GAM RNA, and which when bound by GAM8380 RNA causes inhibition of translation of the GAM8380 target mRNA into a corresponding GAM8380 target protein.

The mechanism of the translational inhibition exerted by GAM8380 RNA, herein designated GAM RNA, on one or more GAM8380 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8380 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8380 RNA, herein designated GAM RNA, of GAM8380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8380 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8380 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8380 RNA correlate with, and may be deduced from, the identity of the GAM8380 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8386 6770 GGCTTGGGCC Fig. 8 further provides a conceptual description of another novel bioinformatically

GACCCCAGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAGCCCATC Messenger 8386 (GAM8386) oligonucleotides modulates expression of respective target genes

ACCTTCTTTT whose function and utility is known in the art.

TGGGGTTTGG GAM8386 is a novel bioinformatically detectable regulatory, non protein coding,

GGCTTGGCC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8386 was detected is

described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM8386 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8386 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8386 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8386 precursor RNA is designated SEQ ID:6770, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6770 is located from position 18386080 to position 18386138 relative to chromosome 19 on the `+` strand.

GAM8386 precursor RNA folds onto itself, forming GAM8386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8386 precursor RNA, designated SEQ ID NO: 6770, and a schematic representation of a predicted secondary folding of GAM8386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8386 folded precursor RNA yielding a GAM8386 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8386 RNA, hereby incorporated herein.

GAM8386 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8386 target RNA, herein designated GAM TARGET RNA. GAM8386 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8386 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8386 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8386 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8386 RNA, herein designated GAM RNA, to target binding sites on GAM8386 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8386 target RNA into GAM8386 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8386 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8386 target genes. The mRNA of each one of this plurality of GAM8386 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8386 RNA, herein designated GAM RNA, and which when bound by GAM8386 RNA causes inhibition of translation of the GAM8386 target mRNA into a corresponding GAM8386 target protein.

The mechanism of the translational inhibition exerted by GAM8386 RNA, herein designated GAM RNA, on one or more GAM8386 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8386 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8386 RNA, herein designated GAM RNA, of GAM8386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8386 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8386 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8386 RNA correlate with, and may be deduced from, the identity of the GAM8386 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8396 7018 TCCACAGTTT Fig. 8 further provides a conceptual description of another novel bioinformatically
GATCTCTTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
CTGTTCCCTC Messenger 8396 (GAM8396) oligonucleotides modulates expression of respective target genes
CACACTCTTC whose function and utility is known in the art.

TTTTGCTCCT GAM8396 is a novel bioinformatically detectable regulatory, non protein coding, CTTCCTGTAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8396 was detected is

TTCAGAGTGG described with additional reference to Figs. 9-15.

TTAAGATCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGAAGTCAGA encoded by the human genome.

CAAGCTATGG GAM8396 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8396

G precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8396

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8396 precursor RNA is designated SEQ ID:7018, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7018 is located from position 113370917 to position 113371017 relative to chromosome 9 on the `-` strand.

GAM8396 precursor RNA folds onto itself, forming GAM8396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8396 precursor RNA, designated SEQ ID NO: 7018, and a schematic representation of a predicted secondary folding of GAM8396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8396 folded precursor RNA yielding a GAM8396 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8396 RNA, hereby incorporated herein. Expression of GAM8396 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM8396 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8396 target RNA, herein designated GAM TARGET RNA. GAM8396 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8396 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8396 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8396 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8396 RNA, herein designated GAM RNA, to target binding sites on GAM8396 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8396 target RNA into GAM8396 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8396 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8396 target genes. The mRNA of each one of this plurality of GAM8396 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8396 RNA, herein designated GAM RNA, and which when bound by GAM8396 RNA causes inhibition of translation of the GAM8396 target mRNA into a corresponding GAM8396 target protein.

The mechanism of the translational inhibition exerted by GAM8396 RNA, herein designated GAM RNA, on one or more GAM8396 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8396 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8396 RNA, herein designated GAM RNA, of GAM8396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8396 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8396 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8396 RNA correlate with, and may be deduced from, the identity of the GAM8396 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8439 7299 TTCCATGGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGGGCCATG detected oligonucleotides of the present invention, referred to here as Genomic Address
ACAGGGAGAT Messenger 8439 (GAM8439) oligonucleotides modulates expression of respective target genes
AGGCCACACC whose function and utility is known in the art.

TTTCCCAGGT GAM8439 is a novel bioinformatically detectable regulatory, non protein coding,
GGAACCTGCA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8439 was detected is

GATGGAG described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM8439 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8439 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8439 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8439 precursor RNA is designated SEQ ID:7299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7299 is located from position 77528891 to position 77528957 relative to chromosome X on the `+` strand.

GAM8439 precursor RNA folds onto itself, forming GAM8439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8439 precursor RNA, designated SEQ ID NO: 7299, and a schematic representation of a predicted secondary folding of GAM8439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8439 folded precursor RNA yielding a GAM8439 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8439 RNA, hereby incorporated herein.

GAM8439 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8439 target RNA, herein designated GAM TARGET RNA. GAM8439 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated

region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8439 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8439 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8439 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8439 RNA, herein designated GAM RNA, to target binding sites on GAM8439 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8439 target RNA into GAM8439 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8439 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8439 target genes. The mRNA of each one of this plurality of GAM8439 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8439 RNA, herein designated GAM RNA, and which when bound by GAM8439 RNA causes inhibition of translation of the GAM8439 target mRNA into a corresponding GAM8439 target protein.

The mechanism of the translational inhibition exerted by GAM8439 RNA, herein designated GAM RNA, on one or more GAM8439 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8439 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8439 RNA, herein designated GAM RNA, of GAM8439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8439 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8439 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8439 RNA correlate with, and may be deduced from, the identity of the GAM8439 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8447 7252 TGGTGGCATA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGCGTGTAAT detected oligonucleotides of the present invention, referred to here as Genomic Address
CCCAGCTACT Messenger 8447 (GAM8447) oligonucleotides modulates expression of respective target genes
TGGGAGGCTG whose function and utility is known in the art.

AGGCAGGAGA GAM8447 is a novel bioinformatically detectable regulatory, non protein coding,
ATTGCTTGAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8447 was detected is

CCCAGGAGGT described with additional reference to Figs. 9-15.

GGAGGTTACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTGAGCAGAG encoded by the human genome.

ATTGCACCA GAM8447 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8447
precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8447
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8447 precursor RNA is designated SEQ ID:7252, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7252 is located from position 26678132 to position 26678230 relative to chromosome 15 on the `+` strand.

GAM8447 precursor RNA folds onto itself, forming GAM8447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8447 precursor RNA, designated SEQ ID NO: 7252, and a schematic representation of a predicted secondary folding of GAM8447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8447 folded precursor RNA yielding a GAM8447 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM8447 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8447 RNA and an

alternative nucleotide sequence thereof, hereby incorporated herein.

GAM8447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8447 target RNA, herein designated GAM TARGET RNA. GAM8447 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8447 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8447 RNA, herein designated GAM RNA, to target binding sites on GAM8447 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8447 target RNA into GAM8447 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8447 target genes. The mRNA of each one of this plurality of GAM8447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8447 RNA, herein designated GAM RNA, and which when bound by GAM8447 RNA causes inhibition of translation of the GAM8447 target mRNA into a corresponding GAM8447 target protein.

The mechanism of the translational inhibition exerted by GAM8447 RNA, herein designated GAM RNA, on one or more GAM8447 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8447 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8447 RNA, herein designated GAM RNA, of GAM8447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8447 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8447 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8447 RNA correlate with, and may be deduced from, the identity of the GAM8447 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8452 6073 CCCAGCCCAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GATTGAATTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGATTAAAGG Messenger 8452 (GAM8452) oligonucleotides modulates expression of respective target genes

AGGCTGAATT whose function and utility is known in the art.

GCAGAGCCTC GAM8452 is a novel bioinformatically detectable regulatory, non protein coding,

CTTTCATCAA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8452 was detected is

ATTCGAGTTT described with additional reference to Figs. 9-15.

TGAATTGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGG encoded by the human genome.

GAM8452 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8452

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8452

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8452 precursor RNA is designated SEQ ID:6073, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6073 is located from position 10844836 to position 10844919 relative to chromosome 1 on the `+` strand.

GAM8452 precursor RNA folds onto itself, forming GAM8452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8452 precursor RNA, designated SEQ ID NO: 6073, and a schematic representation of a predicted secondary folding of GAM8452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8452 folded precursor RNA

yielding a GAM8452 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8452 RNA, hereby incorporated herein.

GAM8452 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8452 target RNA, herein designated GAM TARGET RNA. GAM8452 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8452 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8452 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8452 RNA, herein designated GAM RNA, to target binding sites on GAM8452 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8452 target RNA into GAM8452 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8452 target genes. The mRNA of each one of this plurality of GAM8452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8452 RNA, herein designated GAM RNA, and which when bound by GAM8452 RNA causes inhibition of translation of the GAM8452 target mRNA into a corresponding GAM8452 target protein.

The mechanism of the translational inhibition exerted by GAM8452 RNA, herein designated GAM RNA, on one or more GAM8452 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8452 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8452 RNA, herein designated GAM RNA, of GAM8452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8452 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8452 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8452 RNA correlate with, and may be deduced from, the identity of the GAM8452 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8473 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8473 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8473 RNA correlate with, and may be deduced from, the identity of the GAM8473 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8489 6553 GCTGTTGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGTATGGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTCTGCCCT Messenger 8489 (GAM8489) oligonucleotides modulates expression of respective target genes
TGTCAGAGGA whose function and utility is known in the art.

AGGCTTCCTC GAM8489 is a novel bioinformatically detectable regulatory, non protein coding,
ATCACAAGGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8489 was detected is

AGGGCAGGTG described with additional reference to Figs. 9-15.

TCTGTGCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGC encoded by the human genome.

GAM8489 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8489

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8489

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8489 precursor RNA is designated SEQ ID:6553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6553 is located from position 49193542 to position 49193626 relative to chromosome 15 on the `+` strand.

GAM8489 precursor RNA folds onto itself, forming GAM8489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8489 precursor RNA, designated SEQ ID NO: 6553, and a schematic representation of a predicted secondary folding of GAM8489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8489 folded precursor RNA yielding a GAM8489 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM8489 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8489 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM8489 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8489 target RNA, herein designated GAM TARGET RNA. GAM8489 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8489 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8489 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8489 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8489 RNA, herein designated GAM RNA, to target binding sites on GAM8489 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8489 target RNA into GAM8489 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8489 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8489 target genes. The mRNA of each one of this plurality of GAM8489 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8489 RNA, herein designated GAM RNA, and which when bound by GAM8489 RNA causes inhibition of translation of the GAM8489 target mRNA into a corresponding GAM8489 target protein.

The mechanism of the translational inhibition exerted by GAM8489 RNA, herein designated GAM RNA, on one or more GAM8489 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8489 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8489 RNA, herein designated GAM RNA, of GAM8489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8489 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8489 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8489 RNA correlate with, and may be deduced from, the identity of the GAM8489 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8506 7337 TTGGTTAGGT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGGAACCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTAAATGAC Messenger 8506 (GAM8506) oligonucleotides modulates expression of respective target genes

GCACTATGTG whose function and utility is known in the art.

ATTCCTGTGT GAM8506 is a novel bioinformatically detectable regulatory, non protein coding,

CATATAGAAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8506 was detected is

GTTCTATGAT described with additional reference to Figs. 9-15.

TCTTAGCCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8506 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8506

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8506

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8506 precursor RNA is designated SEQ ID:7337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ

ID:7337 is located from position 80296015 to position 80296094 relative to chromosome 14 on the `+` strand.

GAM8506 precursor RNA folds onto itself, forming GAM8506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8506 precursor RNA, designated SEQ ID NO: 7337, and a schematic representation of a predicted secondary folding of GAM8506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8506 folded precursor RNA yielding a GAM8506 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8506 RNA, hereby incorporated herein.

GAM8506 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8506 target RNA, herein designated GAM TARGET RNA. GAM8506 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8506 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8506 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8506 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8506 RNA, herein designated GAM RNA, to target binding sites on GAM8506 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8506 target RNA into GAM8506 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8506 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8506 target genes. The mRNA of each one of this

plurality of GAM8506 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8506 RNA, herein designated GAM RNA, and which when bound by GAM8506 RNA causes inhibition of translation of the GAM8506 target mRNA into a corresponding GAM8506 target protein.

The mechanism of the translational inhibition exerted by GAM8506 RNA, herein designated GAM RNA, on one or more GAM8506 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8506 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8506 RNA, herein designated GAM RNA, of GAM8506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8506 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8506 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8506 RNA correlate with, and may be deduced from, the identity of the GAM8506 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8531 7188 TGATAGCAAC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTGCTTCCT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGCCTCAGGA Messenger 8531 (GAM8531) oligonucleotides modulates expression of respective target genes
CAGGTTTGTG whose function and utility is known in the art.

GCAAGGAAGA GAM8531 is a novel bioinformatically detectable regulatory, non protein coding,
AAGCAGAAGT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8531 was detected is

TGCTTTCA described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM8531 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8531

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM8531

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8531 precursor RNA is designated SEQ ID:7188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7188 is located from position 80266794 to position 80266861 relative to chromosome 12 on the `+` strand.

GAM8531 precursor RNA folds onto itself, forming GAM8531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8531 precursor RNA, designated SEQ ID NO: 7188, and a schematic representation of a predicted secondary folding of GAM8531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8531 folded precursor RNA yielding a GAM8531 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8531 RNA, hereby incorporated herein.

GAM8531 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8531 target RNA, herein designated GAM TARGET RNA. GAM8531 target

RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8531 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8531 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8531 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8531 RNA, herein designated GAM RNA, to target binding sites on GAM8531 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8531 target RNA

into GAM8531 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8531 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8531 target genes. The mRNA of each one of this plurality of GAM8531 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8531 RNA, herein designated GAM RNA, and which when bound by GAM8531 RNA causes inhibition of translation of the GAM8531 target mRNA into a corresponding GAM8531 target protein.

The mechanism of the translational inhibition exerted by GAM8531 RNA, herein designated GAM RNA, on one or more GAM8531 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8531 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8531 RNA, herein designated GAM RNA, of GAM8531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8531 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8531 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8531 RNA correlate with, and may be deduced from, the identity of the GAM8531 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8539 6962 TACTTGGGAT Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGTTAGTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAGCCTGCA Messenger 8539 (GAM8539) oligonucleotides modulates expression of respective target genes
AAGCAAGTGG whose function and utility is known in the art.

CTTGGAGAGA GAM8539 is a novel bioinformatically detectable regulatory, non protein coding,
TAGTGATTTA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8539 was detected is

GCTCAAGAGG described with additional reference to Figs. 9-15.

GAGTGAGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGACTGTTGC encoded by the human genome.

CACATGTTAA GAM8539 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8539
ATGCTTTTCT precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8539
GGGCCTGATT precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar
ATTTAAGGGA to the nucleotide sequence of GAM8539 precursor RNA is designated SEQ ID:6962, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6962 is located from position 88200943 to position 88201072 relative to chromosome 11 on the `+` strand.

GAM8539 precursor RNA folds onto itself, forming GAM8539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8539 precursor RNA, designated SEQ ID NO: 6962, and a schematic representation of a predicted secondary folding of GAM8539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8539 folded precursor RNA yielding a GAM8539 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8539 RNA, hereby incorporated herein.

GAM8539 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8539 target RNA, herein designated GAM TARGET RNA. GAM8539 target RNA
comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8539 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8539 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8539 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8539 RNA, herein designated GAM RNA, to target binding sites on GAM8539 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8539 target RNA into GAM8539 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8539 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8539 target genes. The mRNA of each one of this plurality of GAM8539 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8539 RNA, herein designated GAM RNA, and which when bound by GAM8539 RNA causes inhibition of translation of the GAM8539 target mRNA into a corresponding GAM8539 target protein.

The mechanism of the translational inhibition exerted by GAM8539 RNA, herein designated GAM RNA, on one or more GAM8539 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8539 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8539 RNA, herein designated GAM RNA, of GAM8539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8539 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8539 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8539 RNA correlate with, and may be deduced from, the identity of the GAM8539 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8542 6913 GTGGCGTTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCCCTTAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGTAGGTGA Messenger 8542 (GAM8542) oligonucleotides modulates expression of respective target genes

CCCAGGGTGG whose function and utility is known in the art.

CTTTGCTTTG GAM8542 is a novel bioinformatically detectable regulatory, non protein coding, GCAAGGGAGA micro RNA (miRNA)-like oligonucleotide. The method by which GAM8542 was detected is

AGTCAC described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8542 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8542

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8542

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8542 precursor RNA is designated SEQ ID:6913, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6913 is located from position 25177054 to position 25177119 relative to chromosome 16 on the `-` strand.

GAM8542 precursor RNA folds onto itself, forming GAM8542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8542 precursor RNA, designated SEQ ID NO: 6913, and a schematic representation of a predicted secondary folding of GAM8542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8542 folded precursor RNA yielding a GAM8542 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8542 RNA, hereby incorporated herein.

GAM8542 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8542 target RNA, herein designated GAM TARGET RNA. GAM8542 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8542 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8542 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8542 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8542 RNA, herein designated GAM RNA, to target binding sites on GAM8542 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8542 target RNA into GAM8542 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8542 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8542 target genes. The mRNA of each one of this plurality of GAM8542 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8542 RNA, herein designated GAM RNA, and which when bound by GAM8542 RNA causes inhibition of translation of the GAM8542 target mRNA into a corresponding GAM8542 target protein.

The mechanism of the translational inhibition exerted by GAM8542 RNA, herein designated GAM RNA, on one or more GAM8542 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8542 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8542 RNA, herein designated GAM RNA, of GAM8542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8542 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8542 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8542 RNA correlate with, and may be deduced from, the identity of the GAM8542 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8563 5691 ACATGTCATA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAGCCTCC detected oligonucleotides of the present invention, referred to here as Genomic Address TACTGAACTC Messenger 8563 (GAM8563) oligonucleotides modulates expression of respective target genes AGCCACATAT whose function and utility is known in the art.

GGAAGTTTGA GAM8563 is a novel bioinformatically detectable regulatory, non protein coding, AGTGGGTCCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8563 was detected is

CGAAATGCAT described with additional reference to Figs. 9-15.

GT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8563 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8563

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8563

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8563 precursor RNA is designated SEQ ID:5691, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5691 is located from position 81283739 to position 81283810 relative to chromosome 8 on the `-` strand.

GAM8563 precursor RNA folds onto itself, forming GAM8563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8563 precursor RNA, designated SEQ ID NO: 5691, and a schematic representation of a predicted secondary folding of GAM8563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8563 folded precursor RNA yielding a GAM8563 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8563 RNA, hereby incorporated herein.

GAM8563 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8563 target RNA, herein designated GAM TARGET RNA. GAM8563 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8563 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8563 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8563 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8563 RNA, herein designated GAM RNA, to target binding sites on GAM8563 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8563 target RNA into GAM8563 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8563 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8563 target genes. The mRNA of each one of this plurality of GAM8563 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8563 RNA, herein designated GAM RNA, and which when bound by GAM8563 RNA causes inhibition of translation of the GAM8563 target mRNA into a corresponding GAM8563 target protein.

The mechanism of the translational inhibition exerted by GAM8563 RNA, herein designated GAM RNA, on one or more GAM8563 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8563 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8563 RNA, herein designated GAM RNA, of GAM8563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8563 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8563 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8563 RNA correlate with, and may be deduced from, the identity of the GAM8563 target gene inhibited

thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8598 7350 TTTTGGCCCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGCTCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
TAACAGAGTG Messenger 8598 (GAM8598) oligonucleotides modulates expression of respective target genes
TTTGAGGGAC whose function and utility is known in the art.

AACTTTCACA GAM8598 is a novel bioinformatically detectable regulatory, non protein coding,
TTTGAGTTTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8598 was detected is

TCCAAAATTA described with additional reference to Figs. 9-15.

AAGGTTGTAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGAGTCACA encoded by the human genome.

GTATCTATTG GAM8598 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8598
TCAAAA precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8598

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8598 precursor RNA is designated SEQ ID:7350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7350 is located from position 31954902 to position 31955007 relative to chromosome 21 on the `+` strand.

GAM8598 precursor RNA folds onto itself, forming GAM8598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8598 precursor RNA, designated SEQ ID NO: 7350, and a schematic representation of a predicted secondary folding of GAM8598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8598 folded precursor RNA yielding a GAM8598 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8598 RNA, hereby incorporated herein.

GAM8598 target gene, herein designated GAM TARGET GENE, encodes a corresponding

messenger RNA, GAM8598 target RNA, herein designated GAM TARGET RNA. GAM8598 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8598 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8598 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8598 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8598 RNA, herein designated GAM RNA, to target binding sites on GAM8598 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8598 target RNA into GAM8598 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8598 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8598 target genes. The mRNA of each one of this plurality of GAM8598 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8598 RNA, herein designated GAM RNA, and which when bound by GAM8598 RNA causes inhibition of translation of the GAM8598 target mRNA into a corresponding GAM8598 target protein.

The mechanism of the translational inhibition exerted by GAM8598 RNA, herein designated GAM RNA, on one or more GAM8598 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8598 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8598 RNA, herein designated GAM RNA, of GAM8598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8598 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target

binding sites to GAM8598 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8598 RNA correlate with, and may be deduced from, the identity of the GAM8598 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8601 6954 TAAATTGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGACAGAAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAGAGCTAG Messenger 8601 (GAM8601) oligonucleotides modulates expression of respective target genes

GAAGTGGTAT whose function and utility is known in the art.

ATTTAATTTC GAM8601 is a novel bioinformatically detectable regulatory, non protein coding,

TAGATTTCAG micro RNA (miRNA)-like oligonucleotide. The method by which GAM8601 was detected is

GGCTGGAGTG described with additional reference to Figs. 9-15.

GTGGAGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM8601 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8601

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8601

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8601 precursor RNA is designated SEQ ID:6954, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6954 is located from position 114561400 to position 114561477 relative to chromosome 9 on the `+` strand.

GAM8601 precursor RNA folds onto itself, forming GAM8601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8601 precursor RNA, designated SEQ ID NO: 6954, and a schematic representation of a predicted secondary folding of GAM8601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8601 folded precursor RNA yielding a GAM8601 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an

enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8601 RNA, hereby incorporated herein.

GAM8601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8601 target RNA, herein designated GAM TARGET RNA. GAM8601 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8601 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8601 RNA, herein designated GAM RNA, to target binding sites on GAM8601 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8601 target RNA into GAM8601 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8601 target genes. The mRNA of each one of this plurality of GAM8601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8601 RNA, herein designated GAM RNA, and which when bound by GAM8601 RNA causes inhibition of translation of the GAM8601 target mRNA into a corresponding GAM8601 target protein.

The mechanism of the translational inhibition exerted by GAM8601 RNA, herein designated GAM RNA, on one or more GAM8601 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8601 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8601 RNA, herein designated GAM RNA, of GAM8601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8601 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8601 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8601 RNA correlate with, and may be deduced from, the identity of the GAM8601 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8631 7028 TCCCGGAGTT Fig. 8 further provides a conceptual description of another novel bioinformatically
TATGGTCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGAGAAGATC Messenger 8631 (GAM8631) oligonucleotides modulates expression of respective target genes
CCTGCTCTGA whose function and utility is known in the art.

GTCACTGCCA GAM8631 is a novel bioinformatically detectable regulatory, non protein coding,
AGCTCTAGCT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8631 was detected is

ATGTGACTTT described with additional reference to Figs. 9-15.

GAACAGGGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTCTGTCCC encoded by the human genome.

TATCTATAAA GAM8631 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8631
ATAAACGGGG precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8631
precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8631 precursor RNA is designated SEQ ID:7028, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7028 is located from position 30319063 to position 30319172 relative to chromosome 17 on the `+` strand.

GAM8631 precursor RNA folds onto itself, forming GAM8631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8631 precursor RNA, designated SEQ ID NO: 7028, and a schematic representation of a predicted secondary folding of GAM8631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8631 folded precursor RNA yielding a GAM8631 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8631 RNA, hereby incorporated herein.

GAM8631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8631 target RNA, herein designated GAM TARGET RNA. GAM8631 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8631 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8631 RNA, herein designated GAM RNA, to target binding sites on GAM8631 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8631 target RNA into GAM8631 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8631 target genes. The mRNA of each one of this plurality of GAM8631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8631 RNA, herein designated GAM RNA, and which when bound by GAM8631 RNA causes inhibition of translation of the GAM8631 target mRNA into a corresponding GAM8631 target protein.

The mechanism of the translational inhibition exerted by GAM8631 RNA, herein designated GAM RNA, on one or more GAM8631 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8631 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8631 RNA, herein designated GAM RNA, of GAM8631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8631 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8631 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8631 RNA correlate with, and may be deduced from, the identity of the GAM8631 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8636 6453 GAGGTAGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTTAACTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGCACCCTG Messenger 8636 (GAM8636) oligonucleotides modulates expression of respective target genes

TGAGGTAGGT whose function and utility is known in the art.

GCTTTAACTG GAM8636 is a novel bioinformatically detectable regulatory, non protein coding,

TGTGCACATT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8636 was detected is

GTGAGGTAGG described with additional reference to Figs. 9-15.

TGCTGAAACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTTC encoded by the human genome.

GAM8636 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8636

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8636

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8636 precursor RNA is designated SEQ ID:6453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6453 is located from position 93614982 to position 93615066 relative to chromosome 14 on the `+` strand.

GAM8636 precursor RNA folds onto itself, forming GAM8636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8636 precursor RNA, designated SEQ ID NO: 6453, and a schematic representation of a predicted secondary folding of GAM8636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8636 folded precursor RNA yielding a GAM8636 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8636 RNA, hereby incorporated herein.

GAM8636 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8636 target RNA, herein designated GAM TARGET RNA. GAM8636 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8636 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8636 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8636 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8636 RNA, herein designated GAM RNA, to target binding sites on GAM8636 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8636 target RNA into GAM8636 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8636 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8636 target genes. The mRNA of each one of this plurality of GAM8636 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8636 RNA, herein designated GAM RNA, and which when bound by GAM8636 RNA causes inhibition of translation of the GAM8636 target mRNA into a corresponding GAM8636 target protein.

The mechanism of the translational inhibition exerted by GAM8636 RNA, herein designated GAM RNA, on one or more GAM8636 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8636 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8636 RNA, herein designated GAM RNA, of GAM8636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8636 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8636 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8636 RNA correlate with, and may be deduced from, the identity of the GAM8636 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCCCTGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGTGGAACA Messenger 8647 (GAM8647) oligonucleotides modulates expression of respective target genes

GAAGCAGCTT whose function and utility is known in the art.

CCTTCAGAGA GAM8647 is a novel bioinformatically detectable regulatory, non protein coding,

AGACTGCAGC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8647 was detected is

TCCCAAGGAC described with additional reference to Figs. 9-15.

ACAAGCTGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGGATGCTA encoded by the human genome.

GAM8647 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8647

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8647

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8647 precursor RNA is designated SEQ ID:6968, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6968 is located from position 30002913 to position 30003001 relative to chromosome 16 on the `-` strand.

GAM8647 precursor RNA folds onto itself, forming GAM8647 folded precursor RNA,

herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8647 precursor RNA, designated SEQ ID NO: 6968, and a schematic representation of a predicted secondary folding of GAM8647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8647 folded precursor RNA yielding a GAM8647 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8647 RNA, hereby incorporated herein.

GAM8647 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8647 target RNA, herein designated GAM TARGET RNA. GAM8647 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8647 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8647 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8647 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8647 RNA, herein designated GAM RNA, to target binding sites on GAM8647 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8647 target RNA into GAM8647 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8647 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8647 target genes. The mRNA of each one of this plurality of GAM8647 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8647 RNA, herein designated GAM RNA, and which when bound by GAM8647 RNA causes inhibition of translation of the GAM8647 target mRNA into a corresponding GAM8647 target protein.

The mechanism of the translational inhibition exerted by GAM8647 RNA, herein designated GAM RNA, on one or more GAM8647 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8647 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8647 RNA, herein designated GAM RNA, of GAM8647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8647 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8647 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8647 RNA correlate with, and may be deduced from, the identity of the GAM8647 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8665 7134 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AACCTGGGAG Messenger 8665 (GAM8665) oligonucleotides modulates expression of respective target genes

GCAAGAGGTT whose function and utility is known in the art.

GCAGTGAGCT GAM8665 is a novel bioinformatically detectable regulatory, non protein coding,

GAGATCATAC micro RNA (miRNA)-like oligonucleotide. The method by which GAM8665 was detected is

CACTGCACTC described with additional reference to Figs. 9-15.

TGGCCTGGGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACAGAGCGA encoded by the human genome.

GACTGTCTCA GAM8665 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8665

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8665

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8665 precursor RNA is designated SEQ ID:7134, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7134 is located from position 10301954 to position 10302053 relative to chromosome 11 on the `+` strand.

GAM8665 precursor RNA folds onto itself, forming GAM8665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8665 precursor RNA, designated SEQ ID NO: 7134, and a schematic representation of a predicted secondary folding of GAM8665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8665 folded precursor RNA yielding a GAM8665 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8665 RNA, hereby incorporated herein.

GAM8665 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8665 target RNA, herein designated GAM TARGET RNA. GAM8665 target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8665 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8665 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8665 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8665 RNA, herein designated GAM RNA, to target binding sites on GAM8665 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8665 target RNA into GAM8665 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8665 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM8665 target genes. The mRNA of each one of this plurality of GAM8665 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8665 RNA, herein designated GAM RNA, and which when bound by GAM8665 RNA causes inhibition of translation of the GAM8665 target mRNA into a corresponding GAM8665 target protein.

The mechanism of the translational inhibition exerted by GAM8665 RNA, herein designated GAM RNA, on one or more GAM8665 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8665 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8665 RNA, herein designated GAM RNA, of GAM8665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8665 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8665 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8665 RNA correlate with, and may be deduced from, the identity of the GAM8665 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8678 6897 GTGAGATGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
TTCCAGGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TCGTCTTGAG Messenger 8678 (GAM8678) oligonucleotides modulates expression of respective target genes
CACCCATTGC whose function and utility is known in the art.

TCAGAGTTTA GAM8678 is a novel bioinformatically detectable regulatory, non protein coding,
TATTGGACTT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8678 was detected is

GCTTTCTAGC described with additional reference to Figs. 9-15.

ACATACCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM8678 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8678

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8678 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8678 precursor RNA is designated SEQ ID:6897, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6897 is located from position 62449343 to position 62449421 relative to chromosome 19 on the `+` strand.

GAM8678 precursor RNA folds onto itself, forming GAM8678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8678 precursor RNA, designated SEQ ID NO: 6897, and a schematic representation of a predicted secondary folding of GAM8678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8678 folded precursor RNA yielding a GAM8678 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8678 RNA, hereby incorporated herein. Expression of GAM8678 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM8678 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8678 target RNA, herein designated GAM TARGET RNA. GAM8678 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8678 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8678 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8678 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8678 RNA, herein designated GAM RNA, to target

binding sites on GAM8678 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8678 target RNA into GAM8678 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8678 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8678 target genes. The mRNA of each one of this plurality of GAM8678 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8678 RNA, herein designated GAM RNA, and which when bound by GAM8678 RNA causes inhibition of translation of the GAM8678 target mRNA into a corresponding GAM8678 target protein.

The mechanism of the translational inhibition exerted by GAM8678 RNA, herein designated GAM RNA, on one or more GAM8678 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8678 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8678 RNA, herein designated GAM RNA, of GAM8678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8678 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8678 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8678 RNA correlate with, and may be deduced from, the identity of the GAM8678 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM8693 5795 AGGTGGCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGCAATAT detected oligonucleotides of the present invention, referred to here as Genomic Address

CAATCCTTCT Messenger 8693 (GAM8693) oligonucleotides modulates expression of respective target genes

GCATCACACA whose function and utility is known in the art.

GTGGGAAAAG GAM8693 is a novel bioinformatically detectable regulatory, non protein coding,

TTTGTCTCAT micro RNA (miRNA)-like oligonucleotide. The method by which GAM8693 was detected is

TGCAGTTCT described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM8693 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM8693 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM8693 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM8693 precursor RNA is designated SEQ ID:5795, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5795 is located from position 105533389 to position 105533457 relative to chromosome 10 on the `-` strand.

GAM8693 precursor RNA folds onto itself, forming GAM8693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM8693 precursor RNA, designated SEQ ID NO: 5795, and a schematic representation of a predicted secondary folding of GAM8693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM8693 folded precursor RNA yielding a GAM8693 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM8693 RNA, hereby incorporated herein.

GAM8693 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM8693 target RNA, herein designated GAM TARGET RNA. GAM8693 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM8693 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM8693 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM8693 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM8693 RNA, herein designated GAM RNA, to target binding sites on GAM8693 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM8693 target RNA into GAM8693 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM8693 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM8693 target genes. The mRNA of each one of this plurality of GAM8693 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM8693 RNA, herein designated GAM RNA, and which when bound by GAM8693 RNA causes inhibition of translation of the GAM8693 target mRNA into a corresponding GAM8693 target protein.

The mechanism of the translational inhibition exerted by GAM8693 RNA, herein designated GAM RNA, on one or more GAM8693 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM8693 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM8693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM8693 RNA, herein designated GAM RNA, of GAM8693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in

Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM8693 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM8693 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM8693 RNA correlate with, and may be deduced from, the identity of the GAM8693 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336123 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336123 target RNA, herein designated GAM TARGET RNA.

GAM336123 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336123 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336123 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336123 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336123 RNA, herein designated GAM RNA, to target binding sites on GAM336123 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336123 target RNA into GAM336123 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336123 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336123 target genes. The mRNA of each one of this plurality of GAM336123 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336123 RNA, herein designated GAM RNA, and which when bound by GAM336123 RNA causes inhibition of translation of the GAM336123 target mRNA into a corresponding GAM336123 target protein.

The mechanism of the translational inhibition exerted by GAM336123 RNA, herein designated GAM RNA, on one or more GAM336123 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336123 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336123 RNA, herein designated GAM RNA, of

GAM336123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336123 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336123 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336123 RNA correlate with, and may be deduced from, the identity of the GAM336123 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336124 5771 AGGCAGGAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCGCTGGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTGAGAGGC Messenger 336124 (GAM336124) oligonucleotides modulates expression of respective target

GGAGCTTGCA genes whose function and utility is known in the art.

GTGAGCCGAG GAM336124 is a novel bioinformatically detectable regulatory, non protein

ATCGCGCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336124 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGCGAGAC encoded by the human genome.

TCCGTCT GAM336124 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336124 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336124 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336124 precursor RNA is designated SEQ ID:5771, and is provided hereinbelow with reference to the sequence listing part.

GAM336124 precursor RNA folds onto itself, forming GAM336124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336124 precursor RNA, designated SEQ ID NO: 5771, and a schematic representation of a predicted secondary folding of GAM336124 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336124 folded precursor RNA yielding a GAM336124 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336124 RNA, hereby incorporated herein. Expression of GAM336124 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336124 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336124 target RNA, herein designated GAM TARGET RNA.

GAM336124 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336124 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336124 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336124 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336124 RNA, herein designated GAM RNA, to target binding sites on GAM336124 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336124 target RNA into GAM336124 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336124 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336124 target genes. The mRNA of each one of this plurality of GAM336124 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336124 RNA, herein designated GAM RNA, and which when bound by GAM336124 RNA causes inhibition of translation of the GAM336124 target mRNA into a corresponding GAM336124 target protein.

The mechanism of the translational inhibition exerted by GAM336124 RNA, herein designated GAM RNA, on one or more GAM336124 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336124 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336124 RNA, herein designated GAM RNA, of GAM336124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336124 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336124 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336124 RNA correlate with, and may be deduced from, the identity of the GAM336124 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336125 5973 ATGGCGTGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCGGGAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGCTTGCA Messenger 336125 (GAM336125) oligonucleotides modulates expression of respective target

GTGAGCCGAG genes whose function and utility is known in the art.

ATCGAGCCAC GAM336125 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336125 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

AGAGCGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336125 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336125 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336125 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336125 precursor RNA is designated SEQ ID:5973, and is provided hereinbelow with reference to the sequence listing part.

GAM336125 precursor RNA folds onto itself, forming GAM336125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336125 precursor RNA, designated SEQ ID NO: 5973, and a schematic representation of a predicted secondary folding of GAM336125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336125 folded precursor RNA yielding a GAM336125 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336125 RNA, hereby incorporated herein. Expression of GAM336125 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336125 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336125 target RNA, herein designated GAM TARGET RNA.

GAM336125 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336125 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336125 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336125 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336125 RNA, herein designated GAM RNA, to target binding sites on GAM336125 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336125 target RNA into GAM336125 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336125 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336125 target genes. The mRNA of each one of this plurality of GAM336125 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336125 RNA,

herein designated GAM RNA, and which when bound by GAM336125 RNA causes inhibition of translation of the GAM336125 target mRNA into a corresponding GAM336125 target protein.

The mechanism of the translational inhibition exerted by GAM336125 RNA, herein designated GAM RNA, on one or more GAM336125 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336125 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336125 RNA, herein designated GAM RNA, of GAM336125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336125 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336125 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336125 RNA correlate with, and may be deduced from, the identity of the GAM336125 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336128 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336128 target RNA, herein designated GAM TARGET RNA.

GAM336128 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336128 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336128 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336128 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336128 RNA, herein designated GAM RNA, to target binding sites on GAM336128 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336128 target RNA into GAM336128 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336128 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336128 target genes. The mRNA of each one of this plurality of GAM336128 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336128 RNA, herein designated GAM RNA, and which when bound by GAM336128 RNA causes inhibition of translation of the GAM336128 target mRNA into a corresponding GAM336128 target protein.

The mechanism of the translational inhibition exerted by GAM336128 RNA, herein designated GAM RNA, on one or more GAM336128 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336128 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336128 RNA, herein designated GAM RNA, of GAM336128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336128 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336128 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336128 RNA correlate with, and may be deduced from, the identity of the GAM336128 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336129 6204 CTGAGGCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAATCACTT detected oligonucleotides of the present invention, referred to here as Genomic Address
GAACCTGGGA Messenger 336129 (GAM336129) oligonucleotides modulates expression of respective target
AATGGAGGTT genes whose function and utility is known in the art.

GCAGTGAGCC GAM336129 is a novel bioinformatically detectable regulatory, non protein
AAGATTGAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336129 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAAGAGTG encoded by the human genome.

AAACTCTGTC GAM336129 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCAG GAM336129 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336129 precursor RNA is designated SEQ ID:6204, and is provided hereinbelow with reference to the sequence listing part.

GAM336129 precursor RNA folds onto itself, forming GAM336129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336129 precursor RNA, designated SEQ ID NO: 6204, and a schematic representation of a predicted secondary folding of GAM336129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336129 folded precursor RNA yielding a GAM336129 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336129 RNA, hereby incorporated herein.

Expression of GAM336129 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336129 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336129 target RNA, herein designated GAM TARGET RNA.

GAM336129 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336129 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336129 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336129 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336129 RNA, herein designated GAM RNA, to target binding sites on GAM336129 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336129 target RNA into GAM336129 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336129 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336129 target genes. The mRNA of each one of this plurality of GAM336129 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336129 RNA, herein designated GAM RNA, and which when bound by GAM336129 RNA causes inhibition of translation of the GAM336129 target mRNA into a corresponding GAM336129 target protein.

The mechanism of the translational inhibition exerted by GAM336129 RNA, herein designated GAM RNA, on one or more GAM336129 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336129 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336129 RNA, herein designated GAM RNA, of GAM336129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336129 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336129 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336129 RNA correlate with, and may be deduced from, the identity of the GAM336129 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336130 6222 CTGGAACCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

This complementary binding is due to the fact that the nucleotide sequence of GAM336133 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336133 RNA, herein designated GAM RNA, to target binding sites on GAM336133 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336133 target RNA into GAM336133 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336133 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336133 target genes. The mRNA of each one of this plurality of GAM336133 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336133 RNA, herein designated GAM RNA, and which when bound by GAM336133 RNA causes inhibition of translation of the GAM336133 target mRNA into a corresponding GAM336133 target protein.

The mechanism of the translational inhibition exerted by GAM336133 RNA, herein designated GAM RNA, on one or more GAM336133 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336133 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336133 RNA, herein designated GAM RNA, of GAM336133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336133 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336133 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336133 RNA correlate with, and may be deduced from, the identity of the GAM336133 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336134 6304 GAATCGCTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AACCTGGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAGAGGTTG Messenger 336134 (GAM336134) oligonucleotides modulates expression of respective target

CAGTGAGCCG genes whose function and utility is known in the art.

AGATGGCACC GAM336134 is a novel bioinformatically detectable regulatory, non protein

ACTGCACTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336134 was detected

AGCCTGGGCA is described with additional reference to Figs. 9-15.

ACAGAGCAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATTC encoded by the human genome.

GAM336134 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336134 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336134 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336134 precursor RNA is designated SEQ ID:6304, and is provided hereinbelow with reference to the sequence listing part.

GAM336134 precursor RNA folds onto itself, forming GAM336134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336134 precursor RNA, designated SEQ ID NO: 6304, and a schematic representation of a predicted secondary folding of GAM336134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336134 folded precursor RNA yielding a GAM336134 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336134 RNA, hereby incorporated herein. Expression of GAM336134 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336134 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336134 target RNA, herein designated GAM TARGET RNA.

GAM336134 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336134 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336134 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336134 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336134 RNA, herein designated GAM RNA, to target binding sites on GAM336134 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336134 target RNA into GAM336134 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336134 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336134 target genes. The mRNA of each one of this plurality of GAM336134 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336134 RNA, herein designated GAM RNA, and which when bound by GAM336134 RNA causes inhibition of translation of the GAM336134 target mRNA into a corresponding GAM336134 target protein.

The mechanism of the translational inhibition exerted by GAM336134 RNA, herein designated GAM RNA, on one or more GAM336134 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336134 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336134 RNA, herein designated GAM RNA, of GAM336134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336134 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336134 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336134 RNA correlate with, and may be deduced from, the identity of the GAM336134 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336135 6309 GACAGCTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGTTCTGAA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAACTGGGTG Messenger 336135 (GAM336135) oligonucleotides modulates expression of respective target
ATCTTGTGAA genes whose function and utility is known in the art.

ATCTGTGGAC GAM336135 is a novel bioinformatically detectable regulatory, non protein
CCTACATTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336135 was detected
CACTTAGTGT is described with additional reference to Figs. 9-15.

GTACCTAAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTAACGTCC encoded by the human genome.

CAAATAAAGT GAM336135 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CATTCAGTGC GAM336135 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TTTGCAGAAA GAM336135 precursor RNA does not encode a protein. A nucleotide sequence identical or

CAGGTCAAGT highly similar to the nucleotide sequence of GAM336135 precursor RNA is designated SEQ
C ID:6309, and is provided hereinbelow with reference to the sequence listing part.

GAM336135 precursor RNA folds onto itself, forming GAM336135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336135 precursor RNA, designated SEQ ID NO: 6309, and a schematic representation of a predicted secondary folding of GAM336135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336135 folded precursor RNA yielding a GAM336135 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336135 RNA, hereby incorporated herein. Expression of GAM336135 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336135 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336135 target RNA, herein designated GAM TARGET RNA.

GAM336135 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336135 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336135 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336135 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336135 RNA, herein designated GAM RNA, to target binding sites on GAM336135 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336135 target RNA into GAM336135 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336135 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336135 target genes. The mRNA of each one of this plurality of GAM336135 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336135 RNA, herein designated GAM RNA, and which when bound by GAM336135 RNA causes inhibition of translation of the GAM336135 target mRNA into a corresponding GAM336135 target protein.

The mechanism of the translational inhibition exerted by GAM336135 RNA, herein designated GAM RNA, on one or more GAM336135 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336135 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336135 RNA, herein designated GAM RNA, of GAM336135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336135 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336135 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336135 RNA correlate with, and may be deduced from, the identity of the GAM336135 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336136 6321 GAGAATCGCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGAGGAGGT Messenger 336136 (GAM336136) oligonucleotides modulates expression of respective target
TGTGGTGAGC genes whose function and utility is known in the art.

CAAGATCGTG GAM336136 is a novel bioinformatically detectable regulatory, non protein
CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336136 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACTC encoded by the human genome.

GAM336136 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336136 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336136 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336136 precursor RNA is designated SEQ ID:6321, and is provided hereinbelow with reference to the sequence listing part.

GAM336136 precursor RNA folds onto itself, forming GAM336136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336136 precursor RNA, designated SEQ ID NO: 6321, and a schematic representation of a predicted secondary folding of GAM336136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336136 folded precursor RNA yielding a GAM336136 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336136 RNA, hereby incorporated herein. Expression of GAM336136 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336136 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336136 target RNA, herein designated GAM TARGET RNA.

GAM336136 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336136 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336136 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336136 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336136 RNA, herein designated GAM RNA, to target binding sites on GAM336136 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336136 target RNA into GAM336136 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336136 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336136 target genes. The mRNA of each one of this plurality of GAM336136 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336136 RNA, herein designated GAM RNA, and which when bound by GAM336136 RNA causes inhibition of translation of the GAM336136 target mRNA into a corresponding GAM336136 target protein.

The mechanism of the translational inhibition exerted by GAM336136 RNA, herein designated GAM RNA, on one or more GAM336136 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336136 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336136 RNA, herein designated GAM RNA, of GAM336136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336136 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336136 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336136 RNA correlate with, and may be deduced from, the identity of the GAM336136 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336137 6322 GAGAATCGCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGAGGAGGT Messenger 336137 (GAM336137) oligonucleotides modulates expression of respective target
TGTGGTGAGC genes whose function and utility is known in the art.

CAAGATCGTG GAM336137 is a novel bioinformatically detectable regulatory, non protein
CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336137 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACTCCGTC encoded by the human genome.

TC GAM336137 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336137 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336137 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336137 precursor RNA is designated SEQ ID:6322, and is provided hereinbelow with reference to the sequence listing part.

GAM336137 precursor RNA folds onto itself, forming GAM336137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336137 precursor RNA, designated SEQ ID NO: 6322, and a schematic representation of a predicted secondary folding of GAM336137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336137 folded precursor RNA yielding a GAM336137 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336137 RNA, hereby incorporated herein. TGCAGTGAGC genes whose function and utility is known in the art.

CGAGATCATG GAM336138 is a novel bioinformatically detectable regulatory, non protein

CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336138 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAACTC encoded by the human genome.

GAM336138 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336138 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336138 precursor RNA is designated SEQ ID:6325, and is provided hereinbelow with reference to the sequence listing part.

GAM336138 precursor RNA folds onto itself, forming GAM336138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336138 precursor RNA, designated SEQ ID NO: 6325, and a schematic representation of a predicted secondary folding of GAM336138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336138 folded precursor RNA yielding a GAM336138 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336138 RNA, hereby incorporated herein. Expression of GAM336138 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336138 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336138 target RNA, herein designated GAM TARGET RNA.

GAM336138 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336138 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336138 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336138 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336138 RNA, herein designated GAM RNA, to target binding sites on GAM336138 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336138 target RNA into GAM336138 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336138 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336138 target genes. The mRNA of each one of this plurality of GAM336138 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336138 RNA, herein designated GAM RNA, and which when bound by GAM336138 RNA causes inhibition of translation of the GAM336138 target mRNA into a corresponding GAM336138 target protein.

The mechanism of the translational inhibition exerted by GAM336138 RNA, herein designated GAM RNA, on one or more GAM336138 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336138 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336138 RNA, herein designated GAM RNA, of GAM336138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336138 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336138 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336138 RNA correlate with, and may be deduced from, the identity of the GAM336138 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336139 6331 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACCCGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTGGAGGT Messenger 336139 (GAM336139) oligonucleotides modulates expression of respective target

TGTAGTGAGC genes whose function and utility is known in the art.

CGAGATCGCG GAM336139 is a novel bioinformatically detectable regulatory, non protein

CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336139 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTC encoded by the human genome.

GAM336139 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336139 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336139 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336139 precursor RNA is designated SEQ ID:6331, and is provided hereinbelow with reference to the sequence listing part.

GAM336139 precursor RNA folds onto itself, forming GAM336139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336139 precursor RNA, designated SEQ ID NO: 6331, and a schematic representation of a predicted secondary folding of GAM336139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336139 folded precursor RNA yielding a GAM336139 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336139 RNA, hereby incorporated herein. Expression of GAM336139 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336139 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336139 target RNA, herein designated GAM TARGET RNA.

GAM336139 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336139 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336139 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336139 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336139 RNA, herein designated GAM RNA, to target binding sites on GAM336139 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336139 target RNA into GAM336139 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336139 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336139 target genes. The mRNA of each one of this plurality of GAM336139 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336139 RNA, herein designated GAM RNA, and which when bound by GAM336139 RNA causes inhibition of translation of the GAM336139 target mRNA into a corresponding GAM336139 target protein.

The mechanism of the translational inhibition exerted by GAM336139 RNA, herein designated GAM RNA, on one or more GAM336139 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336139 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336139 RNA, herein designated GAM RNA, of GAM336139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336139 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336139 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336139 RNA correlate with, and may be deduced from, the identity of the GAM336139 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336140 6340 GAGACAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCGCTAGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCTAGAGG Messenger 336140 (GAM336140) oligonucleotides modulates expression of respective target
CAGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCAGA GAM336140 is a novel bioinformatically detectable regulatory, non protein
GAGAGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336140 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGTGAA encoded by the human genome.

ATTCCGTCTC GAM336140 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336140 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336140 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336140 precursor RNA is designated SEQ ID:6340, and is provided hereinbelow with reference to the sequence listing part.

GAM336140 precursor RNA folds onto itself, forming GAM336140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336140 precursor RNA, designated SEQ ID NO: 6340, and a schematic representation of a predicted secondary folding of GAM336140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336140 folded precursor RNA yielding a GAM336140 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336140 RNA, hereby incorporated herein. Expression of GAM336140 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336140 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336140 target RNA, herein designated GAM TARGET RNA.

GAM336140 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336140 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336140 RNA, herein designated GAM RNA, to target binding sites on GAM336140 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336140 target RNA into GAM336140 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336140 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336140 target genes. The mRNA of each one of this plurality of GAM336140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336140 RNA, herein designated GAM RNA, and which when bound by GAM336140 RNA causes inhibition of translation of the GAM336140 target mRNA into a corresponding GAM336140 target protein.

The mechanism of the translational inhibition exerted by GAM336140 RNA, herein designated GAM RNA, on one or more GAM336140 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336140 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336140 RNA, herein designated GAM RNA, of GAM336140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336140 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336140 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336140 RNA correlate with, and may be deduced from, the identity of the GAM336140 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336141 6345 GAGACAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

This complementary binding is due to the fact that the nucleotide sequence of GAM336143 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336143 RNA, herein designated GAM RNA, to target binding sites on GAM336143 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336143 target RNA into GAM336143 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336143 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336143 target genes. The mRNA of each one of this plurality of GAM336143 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336143 RNA, herein designated GAM RNA, and which when bound by GAM336143 RNA causes inhibition of translation of the GAM336143 target mRNA into a corresponding GAM336143 target protein.

The mechanism of the translational inhibition exerted by GAM336143 RNA, herein designated GAM RNA, on one or more GAM336143 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336143 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336143 RNA, herein designated GAM RNA, of

GAM336143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336143 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336143 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336143 RNA correlate with, and may be deduced from, the identity of the GAM336143 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336144 6367 GAGGATCCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGTGGGGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAGGCTGCA Messenger 336144 (GAM336144) oligonucleotides modulates expression of respective target

GTGAGCCATG genes whose function and utility is known in the art.

ATCAAGCCAC GAM336144 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336144 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

ACTGAGACAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TC encoded by the human genome.

GAM336144 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336144 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336144 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336144 precursor RNA is designated SEQ ID:6367, and is provided hereinbelow with reference to the sequence listing part.

GAM336144 precursor RNA folds onto itself, forming GAM336144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336144 precursor RNA, designated SEQ ID NO: 6367, and a schematic representation of a predicted secondary folding of GAM336144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336144 folded precursor RNA yielding a GAM336144 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336144 RNA, hereby incorporated herein. Expression of GAM336144 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336144 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336144 target RNA, herein designated GAM TARGET RNA.

GAM336144 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336144 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336144 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336144 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336144 RNA, herein designated GAM RNA, to target binding sites on GAM336144 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336144 target RNA into GAM336144 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336144 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336144 target genes. The mRNA of each one of this plurality of GAM336144 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336144 RNA, herein designated GAM RNA, and which when bound by GAM336144 RNA causes inhibition of translation of the GAM336144 target mRNA into a corresponding GAM336144 target protein.

The mechanism of the translational inhibition exerted by GAM336144 RNA, herein designated GAM RNA, on one or more GAM336144 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336144 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336144 RNA, herein designated GAM RNA, of GAM336144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336144 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336144 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336144 RNA correlate with, and may be deduced from, the identity of the GAM336144 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336145 6368 GAGGATCCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGTGGGGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAGGCTGCA Messenger 336145 (GAM336145) oligonucleotides modulates expression of respective target

GTGAGCCATG genes whose function and utility is known in the art.

ATCAAGCCAC GAM336145 is a novel bioinformatically detectable regulatory, non protein

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336145 was detected

CCTGGGCAAC is described with additional reference to Figs. 9-15.

ACTGAGACAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTCTC encoded by the human genome.

GAM336145 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336145 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336145 precursor RNA is designated SEQ ID:6368, and is provided hereinbelow with reference to the sequence listing part.

GAM336145 precursor RNA folds onto itself, forming GAM336145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336145 precursor RNA, designated SEQ ID NO: 6368, and a schematic representation of a predicted secondary folding of GAM336145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336145 folded precursor RNA yielding a GAM336145 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336145 RNA, hereby incorporated herein. Expression of GAM336145 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336145 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336145 target RNA, herein designated GAM TARGET RNA.

GAM336145 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336145 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336145 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336145 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336145 RNA, herein designated GAM RNA, to target binding sites on GAM336145 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336145 target RNA into GAM336145 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336145 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336145 target genes. The mRNA of each one of this plurality of GAM336145 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336145 RNA, herein designated GAM RNA, and which when bound by GAM336145 RNA causes inhibition of

translation of the GAM336145 target mRNA into a corresponding GAM336145 target protein.

The mechanism of the translational inhibition exerted by GAM336145 RNA, herein designated GAM RNA, on one or more GAM336145 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336145 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336145 RNA, herein designated GAM RNA, of GAM336145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336145 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336145 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336145 RNA correlate with, and may be deduced from, the identity of the GAM336145 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336146 6373 GAGGCAGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCACTTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGGAGG Messenger 336146 (GAM336146) oligonucleotides modulates expression of respective target

TGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCTGA GAM336146 is a novel bioinformatically detectable regulatory, non protein

CATTGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336146 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGGGACA encoded by the human genome.

CTCTGTCTC GAM336146 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336146 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336146 precursor RNA is designated SEQ ID:6373, and is provided hereinbelow with reference to the sequence listing part.

GAM336146 precursor RNA folds onto itself, forming GAM336146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336146 precursor RNA, designated SEQ ID NO: 6373, and a schematic representation of a predicted secondary folding of GAM336146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336146 folded precursor RNA yielding a GAM336146 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336146 RNA, hereby incorporated herein. Expression of GAM336146 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336146 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336146 target RNA, herein designated GAM TARGET RNA.

GAM336146 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336146 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336146 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336146 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336146 RNA, herein designated GAM RNA, to target binding sites on GAM336146 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336146 target RNA

into GAM336146 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336146 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336146 target genes. The mRNA of each one of this plurality of GAM336146 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336146 RNA, herein designated GAM RNA, and which when bound by GAM336146 RNA causes inhibition of translation of the GAM336146 target mRNA into a corresponding GAM336146 target protein.

The mechanism of the translational inhibition exerted by GAM336146 RNA, herein designated GAM RNA, on one or more GAM336146 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequences of a `diced` GAM336146 RNA, herein designated GAM RNA, of GAM336146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336146 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336146 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336146 RNA correlate with, and may be deduced from, the identity of the GAM336146 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336147 6374 GAGGCAGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATGGCCTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAGG Messenger 336147 (GAM336147) oligonucleotides modulates expression of respective target

CGGAGCTTGC genes whose function and utility is known in the art.

AGTGAGCTGA GAM336147 is a novel bioinformatically detectable regulatory, non protein

GATCACGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336147 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGCAAGA encoded by the human genome.

CTCTGTCTC GAM336147 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336147 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336147 precursor RNA is designated SEQ ID:6374, and is provided hereinbelow with reference to the sequence listing part.

GAM336147 precursor RNA folds onto itself, forming GAM336147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336147 precursor RNA, designated SEQ ID NO: 6374, and a schematic representation of a predicted secondary folding of GAM336147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336147 folded precursor RNA yielding a GAM336147 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336147 RNA, hereby incorporated herein. Expression of GAM336147 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336147 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336147 target RNA, herein designated GAM TARGET RNA.

GAM336147 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336147 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336147 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336147 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336147 RNA, herein designated GAM RNA, to target binding sites on GAM336147 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336147 target RNA into GAM336147 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336147 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336147 target genes. The mRNA of each one of this plurality of GAM336147 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336147 RNA, herein designated GAM RNA, and which when bound by GAM336147 RNA causes inhibition of translation of the GAM336147 target mRNA into a corresponding GAM336147 target protein.

The mechanism of the translational inhibition exerted by GAM336147 RNA, herein designated GAM RNA, on one or more GAM336147 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336147 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336147 RNA, herein designated GAM RNA, of GAM336147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336147 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336147 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336147 RNA correlate with, and may be deduced from, the identity of the GAM336147 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336148 6375 GAGGCAGAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGCTCGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCGGGAGAC Messenger 336148 (GAM336148) oligonucleotides modulates expression of respective target

AGAGGTTGCA genes whose function and utility is known in the art.

GTGAGCCGAG GAM336148 is a novel bioinformatically detectable regulatory, non protein
ATTGTGCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336148 was
detected
TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is
a humen gene
AGAGCGAGAC encoded by the human genome.

TGCGTC GAM336148 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336148 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA
genes

GAM336148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336148 precursor RNA is designated SEQ ID:6375, and is provided hereinbelow with reference to the sequence listing part.

GAM336148 precursor RNA folds onto itself, forming GAM336148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336148 precursor RNA, designated SEQ ID NO: 6375, and a schematic representation of a predicted secondary folding of GAM336148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336148 folded precursor RNA yielding a GAM336148 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336148 RNA, hereby incorporated herein. Expression of GAM336148 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336148 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336148 target RNA, herein designated GAM TARGET RNA.

GAM336148 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336148 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336148 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336148 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336148 RNA, herein designated GAM RNA, to target binding sites on GAM336148 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336148 target RNA into GAM336148 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336148 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336148 target genes. The mRNA of each one of this plurality of GAM336148 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336148 RNA, herein designated GAM RNA, and which when bound by GAM336148 RNA causes inhibition of translation of the GAM336148 target mRNA into a corresponding GAM336148 target protein.

The mechanism of the translational inhibition exerted by GAM336148 RNA, herein designated GAM RNA, on one or more GAM336148 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336148 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336148 RNA, herein designated GAM RNA, of GAM336148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336148 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336148 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336148 RNA correlate with, and may be deduced from, the identity of the GAM336148 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336149 6381 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AACAGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCAGGTGG Messenger 336149 (GAM336149) oligonucleotides modulates expression of respective target
CAGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCTGA GAM336149 is a novel bioinformatically detectable regulatory, non protein
GATCATGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336149 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGCGAG encoded by the human genome.

ACTCCGTCTC GAM336149 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336149 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336149 precursor RNA is designated SEQ ID:6381, and is provided hereinbelow with reference to the sequence listing part.

GAM336149 precursor RNA folds onto itself, forming GAM336149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336149 precursor RNA, designated SEQ ID NO: 6381, and a schematic representation of a predicted secondary folding of GAM336149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336149 folded precursor RNA yielding a GAM336149 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336149 RNA, hereby incorporated herein. Expression of GAM336149 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336149 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336149 target RNA, herein designated GAM TARGET RNA.

GAM336149 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336149 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336149 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336149 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336149 RNA, herein designated GAM RNA, to target binding sites on GAM336149 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336149 target RNA into GAM336149 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336149 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336149 target genes. The mRNA of each one of this plurality of GAM336149 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336149 RNA, herein designated GAM RNA, and which when bound by GAM336149 RNA causes inhibition of translation of the GAM336149 target mRNA into a corresponding GAM336149 target protein.

The mechanism of the translational inhibition exerted by GAM336149 RNA, herein designated GAM RNA, on one or more GAM336149 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336149 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336149 RNA, herein designated GAM RNA, of GAM336149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336149 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336149 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336149 RNA correlate with, and may be deduced from, the identity of the GAM336149 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336150 6386 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCTGGGAAA Messenger 336150 (GAM336150) oligonucleotides modulates expression of respective target
TGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM336150 is a novel bioinformatically detectable regulatory, non protein
GATTGAGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336150 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGTGAA encoded by the human genome.

ACTCTGTCTC GAM336150 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336150 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336150 precursor RNA is designated SEQ ID:6386, and is provided hereinbelow with reference to the sequence listing part.

GAM336150 precursor RNA folds onto itself, forming GAM336150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336150 precursor RNA, designated SEQ ID NO: 6386, and a schematic representation of a predicted secondary folding of GAM336150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336150 folded precursor RNA yielding a GAM336150 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336150 RNA, hereby incorporated herein. Expression of GAM336150 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336150 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336150 target RNA, herein designated GAM TARGET RNA.

GAM336150 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336150 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336150 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336150 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336150 RNA, herein designated GAM RNA, to target binding sites on GAM336150 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336150 target RNA into GAM336150 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336150 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336150 target genes. The mRNA of each one of this plurality of GAM336150 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336150 RNA, herein designated GAM RNA, and which when bound by GAM336150 RNA causes inhibition of translation of the GAM336150 target mRNA into a corresponding GAM336150 target protein.

The mechanism of the translational inhibition exerted by GAM336150 RNA, herein designated GAM RNA, on one or more GAM336150 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336150 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336150 RNA, herein designated GAM RNA, of GAM336150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336150 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336150 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336150 RNA correlate with, and may be deduced from, the identity of the GAM336150 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336151 6387 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCTGGGAGA Messenger 336151 (GAM336151) oligonucleotides modulates expression of respective target
TGGAGGTTGC genes whose function and utility is known in the art.

GGTGAGCCGA GAM336151 is a novel bioinformatically detectable regulatory, non protein
GATCGCATCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336151 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGCGAA encoded by the human genome.

ACTCTGTCTC GAM336151 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336151 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336151 precursor RNA is designated SEQ ID:6387, and is provided hereinbelow with reference to the sequence listing part.

GAM336151 precursor RNA folds onto itself, forming GAM336151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336151 precursor RNA, designated SEQ ID NO: 6387, and a schematic representation of a predicted secondary folding of GAM336151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336151 folded precursor RNA yielding a GAM336151 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336151 RNA, hereby incorporated herein. Expression of GAM336151 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336151 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336151 target RNA, herein designated GAM TARGET RNA.

GAM336151 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336151 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336151 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336151 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336151 RNA, herein designated GAM RNA, to target binding sites on GAM336151 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336151 target RNA into GAM336151 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336151 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336151 target genes. The mRNA of each one of this plurality of GAM336151 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336151 RNA, herein designated GAM RNA, and which when bound by GAM336151 RNA causes inhibition of translation of the GAM336151 target mRNA into a corresponding GAM336151 target protein.

The mechanism of the translational inhibition exerted by GAM336151 RNA, herein

designated GAM RNA, on one or more GAM336151 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336151 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336151 RNA, herein designated GAM RNA, of GAM336151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336151 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336151 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336151 RNA correlate with, and may be deduced from, the identity of the GAM336151 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCCAGGAGG Messenger 336154 (GAM336154) oligonucleotides modulates expression of respective target

CGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM336154 is a novel bioinformatically detectable regulatory, non protein
GATTGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336154 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAAAGCAAA encoded by the human genome.

ACTTCGTCTC GAM336154 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336154 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336154 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336154 precursor RNA is designated SEQ ID:6392, and is provided hereinbelow with reference to the sequence listing part.

GAM336154 precursor RNA folds onto itself, forming GAM336154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336154 precursor RNA, designated SEQ ID NO: 6392, and a schematic representation of a predicted secondary folding of GAM336154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336154 folded precursor RNA yielding a GAM336154 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336154 RNA, hereby incorporated herein. Expression of GAM336154 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336154 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336154 target RNA, herein designated GAM TARGET RNA.

GAM336154 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336154 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336154 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336154 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336154 RNA, herein designated GAM RNA, to target binding sites on GAM336154 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336154 target RNA into GAM336154 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336154 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336154 target genes. The mRNA of each one of this plurality of GAM336154 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336154 RNA, herein designated GAM RNA, and which when bound by GAM336154 RNA causes inhibition of translation of the GAM336154 target mRNA into a corresponding GAM336154 target protein.

The mechanism of the translational inhibition exerted by GAM336154 RNA, herein designated GAM RNA, on one or more GAM336154 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336154 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336154 RNA, herein designated GAM RNA, of GAM336154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336154 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336154 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336154 RNA correlate with, and may be deduced from, the identity of the GAM336154 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336155 6394 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAGG Messenger 336155 (GAM336155) oligonucleotides modulates expression of respective target

TGGAGGTTGC genes whose function and utility is known in the art.

AGTGTGCCGA GAM336155 is a novel bioinformatically detectable regulatory, non protein

GATCGCGACA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336155 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGGAGTGAAA encoded by the human genome.

TTCTGTCTC GAM336155 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336155 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336155 precursor RNA is designated SEQ ID:6394, and is provided hereinbelow with reference to the sequence listing part.

GAM336155 precursor RNA folds onto itself, forming GAM336155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336155 precursor RNA, designated SEQ ID NO: 6394, and a schematic representation of a predicted secondary folding of GAM336155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336155 folded precursor RNA yielding a GAM336155 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336155 RNA, hereby incorporated herein. Expression of GAM336155 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336155 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336155 target RNA, herein designated GAM TARGET RNA.

GAM336155 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336155 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336155 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336155 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336155 RNA, herein designated GAM RNA, to target binding sites on GAM336155 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336155 target RNA into GAM336155 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336155 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336155 target genes. The mRNA of each one of this plurality of GAM336155 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336155 RNA, herein designated GAM RNA, and which when bound by GAM336155 RNA causes inhibition of translation of the GAM336155 target mRNA into a corresponding GAM336155 target protein.

The mechanism of the translational inhibition exerted by GAM336155 RNA, herein designated GAM RNA, on one or more GAM336155 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336155 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336155 RNA, herein designated GAM RNA, of GAM336155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336155 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336155 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336155 RNA correlate with, and may be deduced from, the identity of the GAM336155 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336156 6398 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCGGGGGG Messenger 336156 (GAM336156) oligonucleotides modulates expression of respective target

CTCTGTCTC GAM336159 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336159 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336159 precursor RNA is designated SEQ ID:6409, and is provided hereinbelow with reference to the sequence listing part.

GAM336159 precursor RNA folds onto itself, forming GAM336159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336159 precursor RNA, designated SEQ ID NO: 6409, and a schematic representation of a predicted secondary folding of GAM336159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336159 folded precursor RNA yielding a GAM336159 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336159 RNA, hereby incorporated herein. Expression of GAM336159 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336159 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336159 target RNA, herein designated GAM TARGET RNA.

GAM336159 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336159 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336159 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336159 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336159 RNA, herein designated GAM RNA, to target binding sites on GAM336159 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336159 target RNA

into GAM336159 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336159 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336159 target genes. The mRNA of each one of this plurality of GAM336159 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336159 RNA, herein designated GAM RNA, and which when bound by GAM336159 RNA causes inhibition of translation of the GAM336159 target mRNA into a corresponding GAM336159 target protein.

The mechanism of the translational inhibition exerted by GAM336159 RNA, herein designated GAM RNA, on one or more GAM336159 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336159 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336159 RNA, herein designated GAM RNA, of GAM336159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336159 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336159 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336159 RNA correlate with, and may be deduced from, the identity of the GAM336159 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336160 6413 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATTACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCAGGAGG Messenger 336160 (GAM336160) oligonucleotides modulates expression of respective target

TGGAGGTTGC genes whose function and utility is known in the art.

GGTGAGTCGA GAM336160 is a novel bioinformatically detectable regulatory, non protein

GATCGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336160 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGCAAA encoded by the human genome.

ACTCCGTCTC GAM336160 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336160 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336160 precursor RNA is designated SEQ ID:6413, and is provided hereinbelow with reference to the sequence listing part.

GAM336160 precursor RNA folds onto itself, forming GAM336160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336160 precursor RNA, designated SEQ ID NO: 6413, and a schematic representation of a predicted secondary folding of GAM336160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336160 folded precursor RNA yielding a GAM336160 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336160 RNA, hereby incorporated herein. Expression of GAM336160 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336160 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336160 target RNA, herein designated GAM TARGET RNA.

GAM336160 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336160 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336160 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336160 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336160 RNA, herein designated GAM RNA, to target binding sites on GAM336160 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336160 target RNA into GAM336160 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336160 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336160 target genes. The mRNA of each one of this plurality of GAM336160 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336160 RNA, herein designated GAM RNA, and which when bound by GAM336160 RNA causes inhibition of translation of the GAM336160 target mRNA into a corresponding GAM336160 target protein.

The mechanism of the translational inhibition exerted by GAM336160 RNA, herein designated GAM RNA, on one or more GAM336160 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336160 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336160 RNA, herein designated GAM RNA, of GAM336160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336160 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336160 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336160 RNA correlate with, and may be deduced from, the identity of the GAM336160 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336161 6417 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAM336164 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336164 precursor RNA is designated SEQ ID:6424, and is provided hereinbelow with reference to the sequence listing part.

GAM336164 precursor RNA folds onto itself, forming GAM336164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336164 precursor RNA, designated SEQ ID NO: 6424, and a schematic representation of a predicted secondary folding of GAM336164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336164 folded precursor RNA yielding a GAM336164 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336164 RNA, hereby incorporated herein. Expression of GAM336164 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336164 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336164 target RNA, herein designated GAM TARGET RNA.

GAM336164 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336164 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336164 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336164 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336164 RNA, herein designated GAM RNA, to target binding sites on GAM336164 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336164 target RNA into GAM336164 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336164 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336164 target genes. The mRNA of each one of this plurality of GAM336164 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336164 RNA, herein designated GAM RNA, and which when bound by GAM336164 RNA causes inhibition of translation of the GAM336164 target mRNA into a corresponding GAM336164 target protein.

The mechanism of the translational inhibition exerted by GAM336164 RNA, herein

designated GAM RNA, on one or more GAM336164 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336164 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336164 RNA, herein designated GAM RNA, of GAM336164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336164 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336164 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336164 RNA correlate with, and may be deduced from, the identity of the GAM336164 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336165 6426 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTCAGGGTC Messenger 336165 (GAM336165) oligonucleotides modulates expression of respective target

AGAGGTCGCA genes whose function and utility is known in the art.

GTGAGCCGAG GAM336165 is a novel bioinformatically detectable regulatory, non protein

ATCCCTCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336165 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGTGAGTC encoded by the human genome.

TCTGTCTC GAM336165 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336165 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336165 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336165 precursor RNA is designated SEQ ID:6426, and is provided hereinbelow with reference to the sequence listing part.

GAM336165 precursor RNA folds onto itself, forming GAM336165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336165 precursor RNA, designated SEQ ID NO: 6426, and a schematic representation of a predicted secondary folding of GAM336165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336165 folded precursor RNA yielding a GAM336165 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336165 RNA, hereby incorporated herein. Expression of GAM336165 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336165 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336165 target RNA, herein designated GAM TARGET RNA.

GAM336165 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336165 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336165 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336165 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336165 RNA, herein designated GAM RNA, to target binding sites on GAM336165 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336165 target RNA into GAM336165 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336165 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336165 target genes. The mRNA of each one of this plurality of GAM336165 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336165 RNA, herein designated GAM RNA, and which when bound by GAM336165 RNA causes inhibition of translation of the GAM336165 target mRNA into a corresponding GAM336165 target protein.

The mechanism of the translational inhibition exerted by GAM336165 RNA, herein designated GAM RNA, on one or more GAM336165 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336165 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336165 RNA, herein designated GAM RNA, of GAM336165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336165 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336165 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336165 RNA correlate with, and may be deduced from, the identity of the GAM336165 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336166 6431 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GATCACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGTGGAAGG Messenger 336166 (GAM336166) oligonucleotides modulates expression of respective target

TTGAGGCTGT genes whose function and utility is known in the art.

AGTGAGCCAT GAM336166 is a novel bioinformatically detectable regulatory, non protein

GATTGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336166 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGAGACA encoded by the human genome.

TCCTTTCTC GAM336166 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336166 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336166 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336166 precursor RNA is designated SEQ ID:6431, and is provided hereinbelow with reference to the sequence listing part.

GAM336166 precursor RNA folds onto itself, forming GAM336166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

ATTGTGACAT Messenger 336169 (GAM336169) oligonucleotides modulates expression of respective target
GGAGAATGTA genes whose function and utility is known in the art.

GAGAAATTAT GAM336169 is a novel bioinformatically detectable regulatory, non protein
TCAATGTTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336169 was detected
GGATCAACAT is described with additional reference to Figs. 9-15.

GATCTCCTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTCTAGGATG encoded by the human genome.

GATCCATACA GAM336169 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CATCCCACTC GAM336169 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
AAACTGC GAM336169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336169 precursor RNA is designated SEQ ID:6499, and is provided hereinbelow with reference to the sequence listing part.

GAM336169 precursor RNA folds onto itself, forming GAM336169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336169 precursor RNA, designated SEQ ID NO: 6499, and a schematic representation of a predicted secondary folding of GAM336169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336169 folded precursor RNA yielding a GAM336169 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336169 RNA, hereby incorporated herein. Expression of GAM336169 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336169 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336169 target RNA, herein designated GAM TARGET RNA.

GAM336169 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336169 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336169 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336169 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336169 RNA, herein designated GAM RNA, to target binding sites on GAM336169 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336169 target RNA into GAM336169 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336169 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336169 target genes. The mRNA of each one of this plurality of GAM336169 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336169 RNA, herein designated GAM RNA, and which when bound by GAM336169 RNA causes inhibition of translation of the GAM336169 target mRNA into a corresponding GAM336169 target protein.

The mechanism of the translational inhibition exerted by GAM336169 RNA, herein designated GAM RNA, on one or more GAM336169 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336169 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336169 RNA, herein designated GAM RNA, of

GAM336169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336169 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336169 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336169 RNA correlate with, and may be deduced from, the identity of the GAM336169 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336170 6519 GCGTGAACCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGAGGCGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTTGCAGTG Messenger 336170 (GAM336170) oligonucleotides modulates expression of respective target

AGCCGAGATC genes whose function and utility is known in the art.

GTGCCACTGC GAM336170 is a novel bioinformatically detectable regulatory, non protein

ACTCCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336170 was detected

GGGCAACAGA is described with additional reference to Figs. 9-15.

GC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336170 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336170 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336170 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336170 precursor RNA is designated SEQ ID:6519, and is provided hereinbelow with reference to the sequence listing part.

GAM336170 precursor RNA folds onto itself, forming GAM336170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336170 precursor RNA, designated SEQ ID NO: 6519, and a schematic representation of a predicted secondary folding of GAM336170 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336170 folded precursor RNA yielding a GAM336170 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336170 RNA, hereby incorporated herein. Expression of GAM336170 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336170 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336170 target RNA, herein designated GAM TARGET RNA.

GAM336170 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336170 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336170 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336170 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions
